CRUSTACEA.

venture very far from their habitations. The clicking noise produced by snapping the claws of their larger fore-leg together, when made by many hundreds at a time, may be heard at some considerable distance. On the least alarm they retreat precipitately to their burrows.

1. GELASIMUS, Latreille.

1. GELASIMUS CULTRIMANUS, Adams & White.

Thorax levì; marginibus lateribus rotundatis, sine carinâ acutâ ab angulo canthi externo.

Fronte, inter oculos, lobo parvo rotundato, dilatato; margine canthi inferiore distincte crenulato; chelâ majore digitis latís, finibus extrorsum curvatis; digito inferiore in medio profunde sinuato, lobo lato, prope extremitatem margine serrato-crenulato; digito superiori margine inferiore fere recto.

Hab. Insulas Philippines.

Carapace with the upper surface smooth; the lateral edges rounded, without any sharp keel from the outer orbital angle.

Front, between the eyes, with a small dilated rounded lobe; edge of lower orbit very distinctly crenated; fifth joint of fore-legs with the claws wide, both slightly curved outwards at the ends; the lower claw with a very wide sinus in the middle, a wide serrato-crenated lobe on the edge near the end; upper claw with the lower edge very nearly straight.

Hab. Philippine Islands.

2. GELASIMUS CRASSIPES, Adams & White.

Thoraco valde incurato, postice subito coarctato.

Fronte lobo sine pedunculo angusto.

Pedibus posterioribus crassioribus et robustioribus quam in speciebus aliis.

Hab. Insulas Philippines.

Carapace very much arched, suddenly narrowed behind.

Front with a lobe, without narrow stalk.

Four hind pairs of legs thicker and stronger than in the other species.

Hab. Philippine Islands.

3. GELASIMUS BELLATOR, Adams & White.

Thorace antice (prope insertionem canthorum pedunculorum) sinuato.

Fronte in lobum rotundatum subdilatatâ; chelis manu digitis perlongis; digito superiore lateribus subparallelis, margine prope ad basin tuberculis duobus vel tribus; digito inferiore infra marginato, acie ad basin sinus superficiali tuberculari, denti robusto lato ad extremitatem.

Hab. Insulas Philippines.

Carapace, in front, just behind the insertion of eye-peduncles, sinuated.

Front slightly dilated into a rounded lobe; fifth joint of the larger fore-leg, with the claws very long; the upper, or movable claw, with the sides nearly parallel, two or three larger
tubercles on the edge near the base; fixed or lower claw margined on the under side; the cutting edge with a very wide shallow tubercular sinus at the base; at the end of the sinus, beyond the middle, a strong wide tooth, gradually sloping down to the end, which curves upwards.

HAB Philippine Islands.

4. GELASIMUS PORCELLANUS, Adams & White.

Oculorum pedunculis perlongis.
Thorace parte frontali non coarctatâ ad basin; parte posteriori longiore quam latera.
Chelis digito inferiore ad finem incrassato, marginibus internis digitorum amborum tuberculis magnis quatuor inter parvos crenulis.

HAB. Borneoem.

Eye-pedicels very long.

Frontal portion of carapace not narrowed at the base; hind part of carapace much longer than the sides.

Fore-legs with the lower claws thickened at the end, the inner margins of both claws with four larger tubercles amongst the small crenules.

HAB. Borneo.

5. GELASIMUS FORCIPATUS, Adams & White.

Thorace valde postice coarcato.
Fronte, inter oculos, lobo dilatato, linea acuto-marginata, ab angulo canthi externo perrectâ.
Chelae majore digitis equalibus, dente prope medium, et prope extremitatem, lobo truncato.

HAB. Borneoem.

Carapace much narrowed behind.

Front with a dilated lobe between the eyes; from the outer orbital angle a sharp-edged line continued beyond the middle of carapace.

Fore-legs with the larger claw nearly equal in size, with a tooth near the middle, and a truncated lobe towards the end; a rather broad impressed line along the middle of each claw; upper edge of palmar portion with a slight ridge; outer side of palm covered with very slight tubercles.

HAB. Borneo.

VII. GONOPLACIDÆ.

The Macrophthalmi inhabit muddy flats along the sea-shores, and, when disturbed, bury themselves quickly in the yielding soil, leaving the ends, however, of their long telescope-eyes above the surface. When taken, they are quite defenceless, not using their fore-legs as organs of aggression, or erecting and snapping them as do the Gelasimi. They are numerously distributed throughout the Philippine Archipelago and the islands in the China Sea.
1. MACROPHTHALMUS, Latreille.

1. MACROPHTHALMUS JAPONICUS, De Haan.
Thorax lato-quadrate, ad latera obtuse dentato; manibus (marium) latere exteriore levibus et inermibus, interiore glaberrimis, carinâ superiore granulatis; digitis (in maribus) deorum inflexis.

Japonice Suna gani, i. e., Cancer arenarius, quod se in arenâ abscondere solet.

Oegyptus (Macrophthalmus) Japonicus, De Haan, F. I. p. 54. t. 15. f. 2. (mas) t. 7. f. 1. (femina.)

HAB. Insulas Meia-co-shimah et Japoniam.

Carapace widely-quadrate, sides obtusely toothed; the fifth joint of fore-legs, in the male, smooth and unarmèd on the outer side, very smooth on the inner side, granulated on the upper keel; claws in the male bent downwards.

In Japanese Suna gani, i. e., Sand Crab, because it is in the habit of burying itself in the sand.

HAB. Meia-co-shimah Islands; Adams. Japan; De Haan.

2. MACROPHTHALMUS DEFINITUS, White.
Thorax anguste-quadrate, lateribus dentibus tribus, angulo canthi inclusus, dente secundo latiore, dente tertio parvo.

Chelis articulis perlongis vix supra marginati, digito superiore dente parvo prope basin; digito inferiori sinu valde profundo, manu infra tuberculâta, interne pilosa.

HAB. Insulas Philippinas.

Carapace narrowly-quadrate; sides with three teeth, including the orbital angle; the second widest, turned up considerably, the third very small.

Fore-legs with the joints very long, scarcely margined above; movable or upper claw with a very slight tooth near the base; fixed or under claw with a very deep sinus; fifth joint tuberculated on the under side, hairy on the inside.

HAB. Philippine Islands.

3. MACROPHTHALMUS SEBRATUS, White.
Thorax anguste-quadrate, lateribus antice dentibus tribus robustis, postice carinâ subcrenulata.

Chelis, manu ab basin interne dilatata, longitudinaliter excavata; digitis pilis longis densis obsitis; digito superiore, in medio, dente truncato.

Pedibus posterioribus, parte superiore, spinâ prope extremitatem.

HAB. Insulas Philippinas.

Carapace narrowly-quadrate, with three strong teeth on the sides in front, succeeded by a slight somewhat crenated keel which margins the rest of the carapace.

Fore-legs with the fifth joint dilated on the inside from the base, and longitudinally hollowed out; inside of both claws densely clothed with long hairs; upper or movable claw with a large truncated tooth in the middle.

Hind-legs with a spine on the upper side near the end.

HAB. Philippine Islands.
2. CHASMAGNATHUS, De Haan.

1. CHASMAGNATHUS CONVEXUS, De Haan.

*Thorax* gibbo, granulato, brevi-setoso, dorso subtetragon, lateribus arcuato. 
*Fronte* arcuata, medio sinuata.  
HAB. Maria orientalia.

*Octypoda (Chasmagnathus) convexa*, De Haan, F. 1. p. 50. t. 7. f. 5.  
*Carapace* gibbose, granulated, shortly-setose, subtetragonal on the back, arched at the sides.  
*Front* arcuata, sinuata in the middle.  
HAB. Eastern Seas.

VIII. GRAPSIDÆ.

The *Sesarmæ* are found in various localities, sometimes in fresh-water rivulets, among weeds; sometimes under damp logs and stones at a considerable distance from any water, and most frequently among the roots of mangroves in salt-water swamps. They are active and extremely wary in their habits, and, like the *Grapsi*, very predacious. The *Grapsus plicatus* is a very common species in Borneo, and appears to vary greatly in colour according to the localities in which it is found. The *Grapsi* are fond of rocks, over which they run with surprising agility; they frequently remain stationary for hours, basking in the sun, when the tide has just left the high rocks.

1. UTICA, White.

*Pedipalpi externi* articulo tertio externo recto non dilatato.  
*Thorax* 8-angulato, depresse, post-media carina transversâ valde distincta; margine latero-anteriore dentibus tribus; parte latero-posteriore obliqua, parte posterior recta.  
*Chelis* parvis.  
Pedibus posterioribus perlongis, tarsos vix dilatato subelongato, pilis imbriato.  

Outer jaw-feet with the third joint, on the outside, straight, not dilated.  
*Carapace* somewhat eight-angled, tubular, a very strong transverse ridge behind the middle; latero-anterior margin with three teeth; latero-posterior part oblique, posteriorly very straight.  
*Fore-legs* small.  
Hind-legs very long, tarsus not particularly dilated, somewhat elongated, fringed with hairs as is the preceding joint.  

This genus is nearly allied to *Trichopus*, De Haan, which is synonymous with *Varuna*, M. Edwards.
1. UTICA GRACILIPES, White. (Pl. XIII. Fig. 6.)

*Fronte latà, anteriore margine valde recto, post-frontem ad medium thoracem pertinentem, eminentia magnà latà subtriangukri, a transversà carinà separatà per altam lunatam depressionem, lineà subimpressà a finibus ad latus carinæ porrrectà. Pedibus gracillimis, pilis fimbriatis.

HAB. Insulas Philippinas.

*Front* wide, fore-edge very straight; behind it and extending to the middle of the carapace, a considerable, wide, somewhat three-sided elevation, separated from the transverse ridge by a deep lunated depression, from the ends of which a slight impressed line proceeds to the side of the ridge, where it deepens.

Hind-legs very slender, and fringed with hair.

HAB. Philippine Islands.

Mr. Cuming found this species in a fresh-water rivulet among the mountains of the Island of Negros. It was also obtained during the Expedition of the Samarang in the Island of Mindanao, in the deep still muddy fresh-water rivulets near Samboangan, hiding under weeds and rotten wood. When caught, it feigns death, contracting its limbs and rendering them perfectly rigid. Its colour, when alive, is dark-red brown, on the under-surface dark chocolate-brown, lighter on the legs and abdomen, which latter in the female has a yellowish line down the middle.

IX. LEUCOSIDÆ.

Besides several species of *Leucosia* new to science, a few *Philyrae* were obtained in the Sooloo Sea, and on the coast of Borneo from a rocky stony bottom; among them was the *P. scabriuscula* of Leach, which, when alive, is of a chocolate colour, with red-brown legs; the *Philyra latifrons* (A. & W.), which is of a deep red brown, with orange forelegs; and another with a dead-white polished carapace, marked with dark olive brown, and the fore-legs banded with the same. The *Philyrae* have much the same habits as the *Leucosia*, being slow-moving, torpid Crustaceans, never using their fore-legs for defence, and living in deep water on a clean rocky or stony floor. A pretty species of *Myra* was dredged in the Sooloo Sea of a delicate flesh colour, with two blood-red spots on the carapace. The *Myra fugax*, which is punctulated and dark liver-coloured on the carapace, and a new species with white carapace and pinkish legs, were also procured; they are found usually in about eight or ten fathoms on a muddy bottom; one species is common in the mud of Manila bay. The *Arcania* are usually of a dead-white colour, variously marked with red, with the legs spotted or banded; they prefer deep water and a clear gravelly bottom; several were dredged on the coast of Borneo in twenty-four fathoms. The *Ixæ* inhabit very deep water, and are inert and feeble; when taken they contract their legs and remain perfectly immovable. The *Iphides* are usually found concealed in madrepores and sponges, and live in a coral bottom in from fifteen to twenty fathoms; they are numerous on the coast of China.
1. **LEUCOSIA, Fabricius.**

1. **LEUCOSIA HEMATOSTICTA, Adams & White.** (Tab. XII. Fig. 2.)

*Thorace trapezoidali supra valde convexo, post angulum latero-anteriorem inscissurâ profundâ, maculis multis sanguineis rotundatis obsitio.*

*Hab.* Maria Orientalia.

*Carapace* trapezoidal, very convex, of a light yellow, covered with numerous small round blood-red spots, fewer posteriorly, and in the middle line a deep notch behind the latero-anterior angle.

*Front* obtuse.

*Fore-legs* with round, scattered, blood-red spots, and a large quadrate mark of the same colour on the outer surface of each claw.

*Hind-legs* with a blood-red band on the upper half of each joint.

*Hab.* Eastern Seas.

2. **OREOPHORUS, Rupell.**

1. **OREOPHORUS RETICULATUS, Adams & White.** (Tab. VI. Fig. 1.)

*Thorace subtrigono, reticulato, fossis subdivisis duabus latero-anterioribus, postice fossa profundâ, in medio tuberculo clypeoformi, regionibus lateralibus valde elevatis.*

*Fronte* rotundatâ antice subemarginatâ supra exsculptâ.

*Chelis* reticulatis.

*Hab.* Maria Orientalia.

*Carapace* subtrigonal, covered with a net-work of beaded lines, the intermediate areas finely granulated; a long semilunar, irregularly-shaped cavity extending along the latero-anterior margin on each side, separated by a strong post-frontal septum, each lateral cavity divided in two portions by two over-arching processes, which unite above, leaving a round foramen of communication; the posterior sublongitudinal portion partially divided by a conical projecting process; a small hole in the floor of the hind portion of the latero-anterior fossa; a cavity at the hind part of carapace nearly divided in two by a granulated tongue-shaped tubercle, and bounded posteriorly by two-obtuse tubercles of the hind margin; a solid shield-shaped reticulated process arising out of the hind part of the cavity; a beaded line around the margins of both fosse; lateral regions convex, elevated into large obtuse prominences; lateral edges coarsely tuberculated.

*Front* thick and rounded, slightly emarginate, rather deeply excavated on the upper surface.

*Fore-legs* covered with coarse reticulations, formed of granulated lines. Upper claw spatulate, slightly curved downwards, flattened above, narrow beneath, a row of pits on the outer and inner margins, under edge tuberculiferous; upper surface with several rows of beaded lines. Under claw horizontally inclined, slightly curved upwards, elongately conical;
CRUSTACEA.

upper surface sharp and granular; under surface thin and tuberculated; inner surface concave, with two finely granulated parallel lines; outer surface convex, with two rows of holes, and two series of tuberculated lines.

Abdomen (of female) convex, wide, divided into about six pits by strong reticulations formed of granuliferous lines.

HAB. Straits of Sunda.

3. IXA, Leach.

1. IXA MEGASPIS, Adams & White. (Tab. XII. Fig. 1.)

Thorax subgranuloso, canalico dorsalibus angustis valde profundiis, postice lineis impressis profunde transversâ; lateribus valde productis granulosis retrorsum inclinatis, finibus oblongis, dente terminali parvo curto.

HAB. Borneonem. Insulas Philippinas.

Carapace subgranular, the channelled grooves which separate the middle from the lateral regions very deep and narrow, a deep transverse posterior groove, the lateral prolongations granular, inclined backwards, long and slender, the ends obtuse, and slightly curved forwards, the stiliform tooth at their extremities very short and small.

HAB. Borneo (Tampasook); Philippines (Bohol).

The species, when alive, has the carapace of a light red colour, with dark crimson in the middle, the lateral prolongations of the carapace being purple, with orange tips: the legs are bright red. It differs from the Iwa cylindrica in the lateral prolongations being inclined backwards, more slender and longer, the ends more obtuse, and curving forwards, the terminal spine is much shorter and smaller, the surface of the carapace is less granular, the middle region is not so deeply notched on each side, the dorsal grooves are narrower and deeper, and the hind groove is more transverse.

4. HARROVIA, Adams & White.

Thorax subpentagono, dense tomentoso, lineis duabus elevatis, tuberculisque quatuor obtusis; margine latere anterioribus dentibus tribus obtusis.

Fronte valde rectâ in medio emarginati, angulo canthi extremero prominenti dentiformi.

Chelis granulosis, brachio supra spinis duabus internae spinâ duplicatâ, carpo tuberculâ unico, manu cylindricâ sulcatâ, digito ad basin tuberculâ parvo extremero.

Carapace subpentagonal, densely tomentose, with two transverse raised lines on the upper surface, each ending externally in a prominent blunt tubercle, and two faintly-impressed lines posteriorly; latero-anterior margins with three obtuse teeth, the anterior small and rounded, the middle large and more prominent, and the posterior strong and conical.

Fronte very straight, emarginate in the middle, the inner angle of the orbits forming a strong tooth in the same line as the front.
Fore-legs granulose, twice the length of the carapace; third joint with two spines on the upper edge, and a double spine on the inner edge; fourth joint with a single tubercle above, and an elongated simple lobe externally; fifth joint subcylindrical, with two longitudinal grooves externally, and a single groove internally.

Claws short; upper claw curved, with a single small tubercle, externally, near the base, lower edge with numerous teeth; lower claw triangular, grooved externally, the upper edge sharp and dentate.

Abdomen (of female) seven-jointed, tomentose, the edges fringed with coarse short hairs.

1. HAKROVTA ALBO-LINEATA, Adams & White. (Tab. XII. Fig. 5.)

Thorace rubro, lineis pallidis.
Chelis carmineis, infra rufescente.
Hab. Borneo et Insulas Philippinas.

Carapace of a red colour, with light transverse markings.

Fore-legs crimson; under surface of body rufous.
Hab. Borneo. Philippine Islands.

5. IPHIS, Leach.

1. IPHIS NOVEM-SPINOSA, Adams & White. (Tab. XIII. Fig. 1.)

Thorace leovi granuloso, granulis antice aggregatis, postice sparsis, marginibus latero-anterioribus spinis duabus subobtusis prorsum et extrorsum porrectis; marginibus latero-posterioribus spinis duabus retrorsum et extrorsum directis, infra has spinis duabus brevis conicis retrorsum et extrorsum porrectis; margine posteriori, spinis longis rectis in medio retrorsum directis.

Fronte in lobos duos conicales divergentes divisati.
Hab. Insulas Philippinas.

Carapace polished, granular, granules close together in front, more sparsely disposed towards the hinder part; latero-anterior borders with two short, stout, somewhat obtuse spines directed forwards and outwards; latero-posterior borders with two long spines directed backwards and a little outwards, with their ends curving upwards, and below these, nearer the middle line, two short conical spines proceeding backwards and outwards; posterior border with a long straight spine in the middle, projecting directly backwards.

Front ending in two conical diverging lobes.
Hab. Philippine Islands (Mindoro).

This species differs from Iphis septem-spinosa of Leach, in the general form of the carapace, which is less triangular, more oval, covered with granules, and wants the sharp ridge which extends along the middle of the carapace of I. septem-spinosa; in the lateral spines being short and curved; in the possession of two additional spines placed anteriorly to these latter; in the greater comparative size of the upper posterior pair of spines; in the
stouter condition of the prehensile and ambulatory feet; and in the well-marked peculiarity of the front.

6. **IPHICULUS, Adams & White.**

_Thorax_ subtilior quam longior, denso tomento spongioso obsitus; marginibus latero-anterioribus spinis quatuor fimbriatis; marginibus latero-posterioribus tuberculis duobus obtusis, parte coarctata lincis impressis duabus longitudinalibus, et sulco transverso, postice tuberculo subelevatisculo.

_Frons_ tuberculis duobus depressis, fissis separatis.

_Chela, manu gibbosA, digitis perlongis, gracilibus, multis denticulis longis instructis._

_Abdomen_ (maris) ad articulum basalem fovea profunda sublongitudinalis.

_Carapace_ rather wider than long, covered with a dense woolly tomentum, resembling fine sponge; latero-anterior margins with four fringed spines, increasing in size from the front backwards, the fourth spine, forming the latero-anterior angle, being very strong and prominent; latero-posterior margins with two obtuse tubercles, separated by a sinus; the coarctate portion of carapace marked by two longitudinal and one transverse groove, and ending in a rounded slightly-elevated tubercle.

_Front_ consisting of two very short depressed tubercles, separated by a notch, each tubercle rounded in front; mouth extending beyond the front.

_Fore-legs_ with the fifth joint gibbous; the claws very long and slender, with numerous fine long sharp teeth.

_Abdomen_ (of male) with its basal joint with a deep sublongitudinal fovea.

1. **IPHICULUS SPONGIOSUS, Adams & White.**

_Thorax_ fusco, tomento spongioso obtecto; marginibus, anteriore spinis quatuor fimbriatis, posteriore tuberculis duobus.

_HAB._ Insulas Philippinas.

_Carapace_ brown, covered with a thick sponge-like woolly tomentum; sides with four fringed spines anteriorly, and two tubercles posteriorly.

_HAB._ Philippine Islands.

This genus should properly follow _Ceratocarcinus_, with which it is closely allied, and should be placed in the same group as that _Crustacean_ it appears, among the _Parthenopide_, to hold the same place as _Oreophorus_ does among the _Leucoside._

7. **TLOS, Adams & White.**

_Thorax_ latior quam longior levis; regionibus lateribus valde excavatis, marginibus lateribus trilobatis, margine posteriorie excavato, loliis bicarinatibus; multis tuberculis parvis ad basin circumdatis.

_Frons_ integra rotundata deorsum reflexa.

_Chela_ branchio triangulare, carpo supra bicarinato, manu carinâ tuberculiferâ, digitis ad fines curvatis.

_Abdomen_ (feminum) articulis septem, ovale tuberculoso.
Carapace much wider than long, smooth, the lateral regions cup-shaped, with raised edges, with an anterior and posterior groove; lateral edges divided into three lobes, the front lobe straight and reflexed backwards, the middle simple and rounded, the posterior elevated and wedge-shaped; the middle region with a strong vertical ridge ending behind in an obtuse tubercle, and on each side with two perpendicular three-sided elevations, truncated at their apices, with a small tubercle at their fore-bases; posterior margin of carapace excavated, with a large projecting lobe flattened above, with two ridges behind, a rounded elevation in front, and numerous small tubercles near the base.

Front entire, rounded, reflected backwards, showing a central groove on the under surface.

Fores-legs with the third joint triangular, the edges tuberculariferous; the fourth joint with two tubercular ridges on the upper surface; fifth joint with a tubercular keel above; claws slightly curved at the ends.

Abdomen (of female) oval, tuberculated, seven-jointed, surrounded by an elevated ridge.

It is interesting to see the analogous armature of the carapace with that of Xanthoasia murigera (White) amongst the Pinnotheridae. The name Tlos is from the town of that name in Lycia, so well described by Sir Charles Fellowes in his Asia Minor. It is distinct enough from Tylus, another genus of Crustacea, so as not to be confounded with it in sound.

1. TLOS MURIGER, Adams & White. (Tab. XIII. Fig. 2.)

Thorace levi, regionibus lateribus valde excavatis; marginibus lateribus trilobatis; margine posterioris excavato, lobo bicarinato multis parvis tuberculis ad basin.

Hab. Borneonem.

Carapace smooth; lateral regions deeply excavated; side-margins with three lobes, hind margin excavated, a two-ridged lobe with numerous small tubercles at the base.

Hab. Borneo.

X. CORYSTIDÆ.

The genus Trichocera is not uncommon among the islands of the Philippine Archipelago, where it is found among the reefs concealed in the coral, or hiding under stones; it has all the habits of the Xantho group; the Corysides inhabits rather deep water, preferring the same localities as the Leucosia, which it likewise resembles in its habits; a species of Gomeza was dredged by Mr. Cuming in the Philippines, but the other genera of this family do not appear to be found among the islands of the Eastern Seas.

1. TRICHOCERA, De Haan.

1. TRICHOCERA GIBBOSULA, De Haan.

Parvus, pilosus, thorace dilatato, brevi, setoso, tuberculato, tuberculis mediis planis quinque transversis dispositis; lateribus 10-dentatis; fronte 5-dentatis.
CRUSTACEA.

HAB. Japonia.

Coryphes (Trichocera) gibbosula, De Haan, Faun. Japon. t. 2. f. 4; t. 13. f. 3.

Small, hairy, the carapace dilated, short, setose, tuberculated, the five middle plane
tubercles disposed transversely; sides ten-toothed; front five-toothed.

2. TRICHOCERA PORCELLANA, Adams & White.

Thoraces depresso levii, lineis multis denticulatis transversis obsitis; lateribus spinis quinque robustis
acutis curvatis.

Fronte valde supra sulcatâ, lobis duobus obtusis dente magno externe.

Chelis levibus, lineis transversis denticulatis obsitis; digito superiore supra dentato; digito inferiore
tuberculis quatuor supra, lineis duabus longitudinalibus infra.

Pedibus posterioribus levibus, pilis longis finibus.

HAB. Insulas Philippines.

Carapace depressed, polished, covered with numerous transverse finely-denticulated
lines, some interrupted and some continued into the lateral spines; sides with five sharp
strong curved spines, the first and last simple, the others with small spines at their bases.

Front deeply grooved above, with two obtuse denticulated lobes, each with a large
tooth externally.

Fore-legs polished, covered with short finely-denticulated transverse lines; claws long,
with the spatulate extremities abruptly curved, upper claw dentated above, with small
 tubercles below, lower claw with four tubercles above, and two longitudinal denticulated lines
 externally.

Hind-legs dilated, smooth, fringed with long hairs.
HAB. Philippine Islands.

By Professor De Haan, the most able of modern Crustaceologists, this species would be
referred to the division which contains Xantho, and we must confess that in its general
appearance it has some resemblance to the Chilian genus Paraxanthus of Lucas, of which
there are specimens in the British Museum; with the genus Thia of the family Coryphidae
it has some considerable analogy, and may be said, in the group Xantho, to represent that
family. Like the Cancer (Xantho) integer of M. De Haan, this species is of a bright yellow
brown, with golden hairs (in the dried state), and both species are found in the Philippine
Archipelago.

XI. HIPPIDÆ.

The genera which compose this small but very natural group have, so far as I have
observed, very nearly the same habits. They swim by sudden rapid jerks, like the Galathca,
and appear to prefer the deep pools of the coral ledges; they are pre-eminently swimming
Crustaceans, progressing but badly when taken from the water. An interesting addition to
our national collection in the form of *Notopus dorsipes*, De Haan, was obtained by us in the province of Unsang in Borneo, and a new genus (*Cosmonotus*) also rewarded our exertions while examining the same locality.

1. **COSMONOTUS, Adams & White.**

*Thorax* ovalis, antice acuminatus, lateribus valde compressis, in lineâ mediâ carinâ prominentes, lateribus integris, angulo latero-anteriore spinâ brevi acutâ.

*Ria* profunde incisa, ad latera spinâ parva acuta.

*Chela* trigonales, internae plane, externae convexe.

*Abdomen* (maris) articulis septem, articulo ultimo trigonali.

*Carapace* oval, very much compressed laterally, especially in front, with a distinct prominent keel extending down the middle line, very strongly marked in front, but fainter posteriorly.

*Front* with a very small spine on each side of a deep angular notch, in which are placed the eyes.

*Fore-legs* strong, triangular, the upper claw arched, the lower claw small and dentated on the edge.

*Abdomen* (in the male) seven-jointed.

1. **COSMONOTUS GRAYII, Adams & White.** (Tab. XIII. Fig. 3.)

*Thorax* punctis multâ depressâ obsitum.

*Ria* valde incisâ externae spinâ parvâ acutâ.

*Chela* trigonalius brachio infra plano, externe convexo lineis multis transversis interruptis, supra carinato pilis fimbriato, internae concavo, carpo incurvato subcompresso, externae convexo, internae spinâ obtusa; manu compressâ asperâ, margine superiore arcuato; digito inferiore angusto, elongato dente robusto prope extremitatem, digito inferiore brevissimo incurvato; pedibus posterioribus gracilibus brevibus.

*Hab.* Borneonem.

*Carapace* about an inch in length and half an inch wide, covered with numerous minute depressed punctures.

*Fore-legs* trigonal, the third joint plane on the under surface, the exterior convex with transverse, interrupted, engraved or impressed lines, the upper angle covered with long thick hairs, the inner surface concave; the fourth joint incurved, sub-compressed, convex externally, less convex internally, ending above and in front in a blunt spine; fifth joint compressed, elevated, with the upper edge arched, but not so sharp as in *Notopus*; the sides convex and covered with asperities or minutely denticulated ridges, interrupted and transverse; upper claw narrow, compressed, elongated, with a sharp apex, and a strong tooth near the distal extremity.

*Feet* short and weak as in *Notopus*; the first tibia bicaudate; the tarsus subquadrate, anteriorly bicaudate, with a scalpel-shaped claw; the second tibia one-keeled, with the tarsus
CRUSTACEA.

oblong, and a sharp elongated trigonal claw; the third tibia subtriangular, the tarsus short, flattened, trigonal, with a falcate claw; the fifth tibia triangular, very short, flattened; tarsus transversely ovate, with a small narrow claw.

*Abdomen* (of male) seven-jointed, the joints from the first to the sixth nearly of the same width as in *Notopus*, the last joint trigonal.

Hab. Borneo (Unsang).

*Cosmontus* differs from *Notopus*, De Haan, in wanting the post-frontal, elevated denti-culated ridge; in the dorsal keel ending abruptly in front, instead of terminating in a central frontal spine; in the front being notched, with a single spine on each side; in the carapace being much compressed, more especially in front, and in the produced and angular form, while in *Notopus* it is almost straight across the front; and in the sides being entire, with a short sharp spine at the antero-lateral angle. The species is named in compliment to J. E. Gray, Esq., F.R.S., Keeper of the Zoological department in the British Museum.

XII. PENÆIDÆ.

A new species of *Sicyonia*, Edwards, of a scarlet colour, finely variegated with orange and yellow, with a greyish pubescence on the dorsal surface near the crest, was obtained in the Sooloo Sea together with a few *Zoæ*. The *Stenopus*, *Sicyonia*, and *Penaeus*, usually swim in a slow and deliberate manner forwards, and occasionally with a sudden jerk propel themselves backwards. They keep at a considerable distance from the shore and seem to love deep still water, never appearing when the surface of the sea is ruffled.

1. STENOPUS, Latreille.

1. STENOPUS HISPIDUS, Latreille. (Tab. XII. Fig. 6.)

Thorace spinis multis parvis pilisque sparsis obsito.

Fronte acuminatâ gracili sursum directâ, non ultra articulum basali anteriores superiorum pertinente; antennis perlongis filiformibus.

Chelis brevioribus quam paria pedum secunda, longe ultra appendicem lamellarem antennarum inferiorum porrectis. Pari tertio pedum longiore quam totum corpus multis seriebus longitudinalibus dentium acutum, tarsis duorum parium ultimorum pedum bifidis.

*Abdomine* lamina media pinum caudalis in centro sulcato, supra seriebus duabus spinarum.

Hab. Insulas Philippinas.

Carapace covered with numerous small spines and scattered hairs.

*Front* pointed, slender, elevated, not extending beyond the basal joint of the upper antennæ; antennæ very long and filiform.
Fore-legs not so long as the second pair, but extending considerably beyond the lamellae appendage of the lower antennae. Third pair of legs longer than the whole body, with many longitudinal rows of pointed teeth; tarsi of the two last pairs of legs bifid.

Abdomen with the middle lamina of the caudal fin grooved in the centre, and furnished above with two rows of spines.

Hab. Coast of Borneo, and Philippine Islands.

Our figure is coloured from a living specimen taken by me in the China Sea. A. A.

[Additional Species.]

CRYPTOSOMA, Brullé.

CRYPTOSOMA ORIENTIS, Adams & White. (Tab. XIII. Fig. 4.)

Thorax rotundato; marginibus latero-posterioribus rectiusculis. Thorax post frontem et oculos incus sulcis.

Fronte tribus lobis subacutis.

Pedicibus gracilibus; articulo pretarsali tenui, non incrassato.

Hab. Maria Orientalia.

Carapace subcircular, as broad as long, narrowed behind, covered with numerous small red tubercles, and five rows of larger tubercles; latero-anterior margins distinctly dentate; latero-anterior angle with a rather long and sharp spine.

Front with three subacute lobes; upper margin of orbit deeply notched in the middle.

Fore-legs with the third joint armed with two long spines on the outer side near the end, the fourth joint tubercular, the fifth joint compressed, with an elevated toothed crest above, and covered externally with tubercular spines.

Hind-legs smooth, slightly compressed, slender, with the pretarsal joints not thickened or dilated.

Abdomen (in the male) four-jointed.

Hab. Eastern Seas.

This species comes very near to Cryptosoma cristatum, figured by Brullé in Webb and Berthelot’s Hist. des Iles Canaries (Tab. Crust. fig. 2). The Mursia cristata, Leach; Cycloes granulosa, De Haan, Faun. Jap. t. 19. f. 3; Thealia acanthophora, Lucas, Ann. Soc. Ent. Fr. 1839, p. 579. t. 21. f. 1 (Mursia armata, De Haan, Faun. Jap. p. 73. t. 19. f. 2); and this species, belong to a group of Calappidae which seems very widely distributed.
CRUSTACEA.

XENOPHTHALMUS *White.

**XENOPHTHALMUS PINNOITHEROIDES, White.** (Tab. XII. Fig. 3.)

*Thorax* punctulato, sulcis duobus longitudinalibus ab oculis porrectis, lateribus antice ciliatis.

*Pedibus* articulis ciliatis.

HAB. Insulas Philippinas.

Carapace with the sides, in front, having a sharp ciliated edge; carapace punctured; two slight waved longitudinal grooves, one extending from each eye over the back of the carapace; most of the joints of the legs ciliated.

HAB. Philippine Islands.

We figure this curious genus on account of our being able to give a coloured representation from a drawing made from life in the Eastern Seas. *A.A.*

**Rhabdosoma, Adams & White.**

*Oxycephalus*, M. Edwards.

We regret that the state of the only specimen in the British Museum is such that we cannot give the generic character with that detail which we should wish. It is founded on the third species of Professor Milne Edwards, indeed Mr. White has the authority of that eminent Crustaceologist that it is his very species: it is so different from the *Oxycephalus piscator*, M. Edwards (Crust. III. p. 100. t. 30. f. 10), that we have traced the figure of *O. piscator*, and added it below that of the *O. armatus*, to show the difference. Some day it may be proved to be a sexual character, when of course our name will sink, but as yet we know of no such discrepancies in the sexes of these Crustacea.

The head is as long as the rest of the body, and ends in a very long beak; from the state of our specimen we cannot describe this, but indicate it on the plate from a drawing made at the time of capture. The immense length of the body and the beak would sufficiently mark this generic form. The first two pairs of legs are shown in the figure, which must serve till we can procure further specimens, when we hope to give ample details of this very singular crustaceans and to analyse its characters at length. It forms a singularly interesting link between the *Amphipoda* and *Lamnodiida*, uniting, as it were, the two; we should like to have this form examined particularly by Prof. M. Edwards or Dr. Kroyer.

**Rhabdosoma Armatum, Adams & White.** (Tab. XIII. Fig. 7.)

*Oxycephalus armatus*, M. Edw. Crust. III. p. 101. pl. 30. f. 10, copied. (Tab. XIII. Fig. 8.)

The specimen described by Professor Milne Edwards was found by MM. Quoy and Gaimard in the ocean between Amboina and Van Dieman's Land, and is now in the Paris Museum. Ours was taken during a calm, floating on the surface of the South Atlantic Ocean.
