CONTENTS

OF THE THIRD VOLUME.

TYPE I. VERTEBROSA.

CLASS MAMMALIA.

- I. On the Characters of the European Species of the Genus
Rhinolophus, commonly named Horse-shoe Bats page 1

CLASS BIRDS.

- II. Generic Character of *Elanus*, a Genus of Birds, with a
Description of a Species - - - - - 4
III. Notice of a Variety in the common Corvorant - - 6

CLASS REPTILES.

- IV. On the Characters of the common Viper - - - - 7

CLASS AMPHIBIA.

- V. A Notice concerning the *Gigantic* or *Great Frog* of Pen-
nant - - - - - 9

CLASS FISHES.

- VI. *Leptocephalus*, its Generic Characters, with a Descrip-
tion of one Species - - - - - 10

TYPE II. ANNULOSA.

CLASS CRUSTACEA.

- VII. On the Characters of *Matuta*, with Descriptions of the
Species - - - - - 12
VIII. Characters of *Micippa*, a new Genus of *Brachyurous*
Malacostraca, with Descriptions of two Species - 15

IX. Monograph on the Genera and Species of the Malocostraceous Family <i>Leucosidea</i> - - - - -	page 17
X. On the Characters of the Genus <i>Thalassina</i> of Latreille, with a Description of one Species - - - - -	27
XI. On the Characters of the Genus <i>Atya</i> of Leach, with a Description of one Species - - - - -	29

CLASS MYRIAPODA.

XII. The Characters of the Genera of the Class <i>Myriapoda</i> , with Descriptions of some Species - - - - -	31
---	----

CLASS ARACHNIDES.

XIII. On the Characters of the Class <i>Arachnides</i> and of its Families - - - - -	46
XIV. On the Characters of the Genera of the Family <i>Scorpionidea</i> , with Descriptions of the British Species of <i>Chelifer</i> and <i>Obisium</i> - - - - -	48

CLASS -----?

XV. Descriptions of three Species of the Genus <i>Pthiridium</i> of Hermann - - - - -	54
---	----

CLASS INSECTS.

XVI. On the Characters of the Class <i>Insecta</i> , and of the Orders composing it - - - - -	57
XVII. On the Families, Stirpes, and Genera of the Order <i>Thysanura</i> - - - - -	61
XVIII. On the Families, Stirpes, and Genera of the Order <i>Anoplura</i> - - - - -	64
XIX. Synopsis of the Stirpes and Genera of the Family <i>Dyticidea</i> - - - - -	68
XX. On the Natural Characters of four Genera which have been confounded under the Name <i>Silpha</i> - - -	74
XXI. A Sketch of the Characters of the Stirpes and Genera of the Family <i>Histeridea</i> - - - - -	76
XXII. On the Stirpes and Genera composing the Family <i>Pselaphidea</i> ; with the Names of the British Species	80

XXIII. Sketch of the Characters of the Genera of <i>Parnidea</i> , a Family of Coleoptera - - - - -	page 88
XXIV. On the distinguishing Characters of two Families of Colcopteroous Insects named <i>Hydrophili</i> by La- treille, with a Synopsis of the Genera composing them	90
XXV. Synopsis of the Genera composing the Family <i>Sphae- rididea</i> - - - - -	95
XXVI. On the distinctive Characters of two Species of the Fabrician Genus <i>Geotrupes</i> , which have been con- founded under the Name of <i>Acteon</i> - - - - -	96
XXVII. Synopsis of three of the Genera of the Order <i>Der- maptera</i> - - - - -	99
XXVIII. On the external Characters of the Stirpes and Ge- nera of the Family <i>Tenthredinidea</i> , with Descriptions of several new Species - - - - -	100
XXIX. On the <i>Rhipiptera</i> of Latreille, an Order of Insects named by Kirby <i>Strepsiptera</i> - - - - -	133

TYPE III. MOLLUSCA.

CLASS CEPHALOPODA.

XXX. Synopsis of the Orders, Families, and Genera of the Class <i>Cephalopoda</i> - - - - -	137

THE
ZOOLOGICAL MISCELLANY.

I. *On the Characters of the European Species of the Genus Rhinolophus, commonly named Horse-shoe Bats.*

RHINOLOPHUS.

Rhinolophus, *Geoffroy-St.-Hilaire, Duméril, Cuvier.*

Dentes incisores superiores 2, simplices, minuti, in os præmaxillare subcartilagineum distanter inserti: *inferiores* 4, approximati, trifidi.

laniarii in utraque mandibula 4.

molares in utraque mandibula 10.

Nasus foliis duobus: posteriore erecto.

Aures liberæ.

Cauda elongata, cum pedibus posticis membrana connecta.

Mammæ, 2 pectorales, 2 inguinales.

The most remarkable character, as Geoffroy has observed, is the presence of the inguinal teats, which are situated one on each side of the vulva.

Geoffroy-St.-Hilaire, to whom naturalists are indebted for a most excellent series of dissertations on the classifications of Bats, has overlooked the two anterior grinding

teeth of the upper jaw, which, although small, are very easily seen.

The following European species* were discovered and admirably distinguished by Daubenton, who was well acquainted with their common and specific characters.

Sp. 1. *Rhinolophus Ferrum-equinum.*

R. molari superiore antico minimo simplici truncato, laniariis simplicibus.

Vespertilio Ferrum-equinum auctorum.

Vespertilio Hippocrepis. Herm. Observ. Zool. 18.

Rhinolophus uni-hastatus. Geoff. Ann. du Mus. 20. 265.

Habitat in Europa gregarius.

This species is common in France; and is not unfrequently found in the caverns which occur in the limestone near Plymouth, and on the southern coast of Devon.

Sp. 2. *Rhinolophus Hipposideros.*

TAB. 121.

R. molari superiore primo acuto; basi antice et postice denticulo armato, laniario superiore antice dente instructo; inferiore simplici.

Vespertilio Ferrum-equinum β. auctorum.

Vespertilio Hipposideros. Bechstein.

Vespertilio minutus. Montagu Trans. Linn. Soc. 9. 163.

Rhinolophus bi-hastatus. Geoff. Ann. du Mus. 20. 265.

Habitat cum praecedente gregarius.

* I have never had an opportunity of examining the Egyptian and Indian species that have been referred to this genus by Geoffroy-St-Hilaire, but strongly suspect that their lower incisor teeth are single and not trifid.

ALBANY
EDWARD
INSTITUTE

Montagu was mistaken in asserting that this species wanted the incisor teeth in its upper jaw: they are certainly not very visible; but may always be found if the integuments be removed with care.

It is a very cautious animal; very easily tamed, but fond of concealing itself. It frequents the higher parts of the caverns in which it occurs, and probably flies higher than the preceding species.

II. Generic Character of *Elanus*, a Genus of Birds,
with a Description of a Species.

ELANUS.

"ΕΛΑΝΟΣ *antiquorum*.

ELANUS. *Savigny, Vieillot.*

FALCO (*Milvus*). *Cuvier.*

Rostrum parvum valde compressum, angulo dorsali arcuato : *cera* semihiispida, brevis : *nares* magnæ, ovales, lobo membranaceo instructæ : *os* ad oculos fissum : *mandibula superior* margine tenui integro, palato molli ; *mand. inferior* apice oblique truncata.

Tarsi brevissimi, squamis parvis subæqualibus instructi, basi pennati : *digiti* crassi, liberi ; intermedio paulo longiore, phalange primo brevissimo : *ungues* magni, inæquales, arcuati, acutissimi, glabri ; interiore et posteriore longioribus, illo latere interno longitudinaliter elevato.

Alæ longissimæ, acuminatæ ; remige primo secundo breviore ; tertio primo paulo longiore ; quarto præcedente abrupte breviore ; remigibus sequentibus jusque ad quatuordecimum gradatim longitudine decrescentes.

Cauda mediocris paulo emarginata.

When I caused a figure of the following bird to be executed, I was not aware that it had been distinguished as a genus by my learned friend Savigny, or I should not have ventured to describe a bird after so eminent a naturalist.

It is more nearly allied to *Milvus* than to any other genus ; but it may very easily be distinguished from it by the above characters, which are nearly the same with those laid down by Savigny.

Elanus melanopterus.

TAB. 122.

E. plumbeus, subtus albidus, remigibus nigricantibus, rostro humerisque nigris, cauda albida, pedibus flavis.

Falco melanopterus. *Dand. Tact. d'Orn.* 2. 152.

Le Blac. *Le Vail. Ois. d'Af.* 1. 36. ♂ 37 junior.

Elanus cæsius. *Savig. Ois. de l'Egypt. &c.* 98. p. ii. f. 2.

The black-winged Elanus, according to Savigny, is found in great abundance in parts of Syria, Egypt, and Barbary. A great number were observed, and some were sent home from the mouth of the river Congo by the late Mr. J. Cranch.

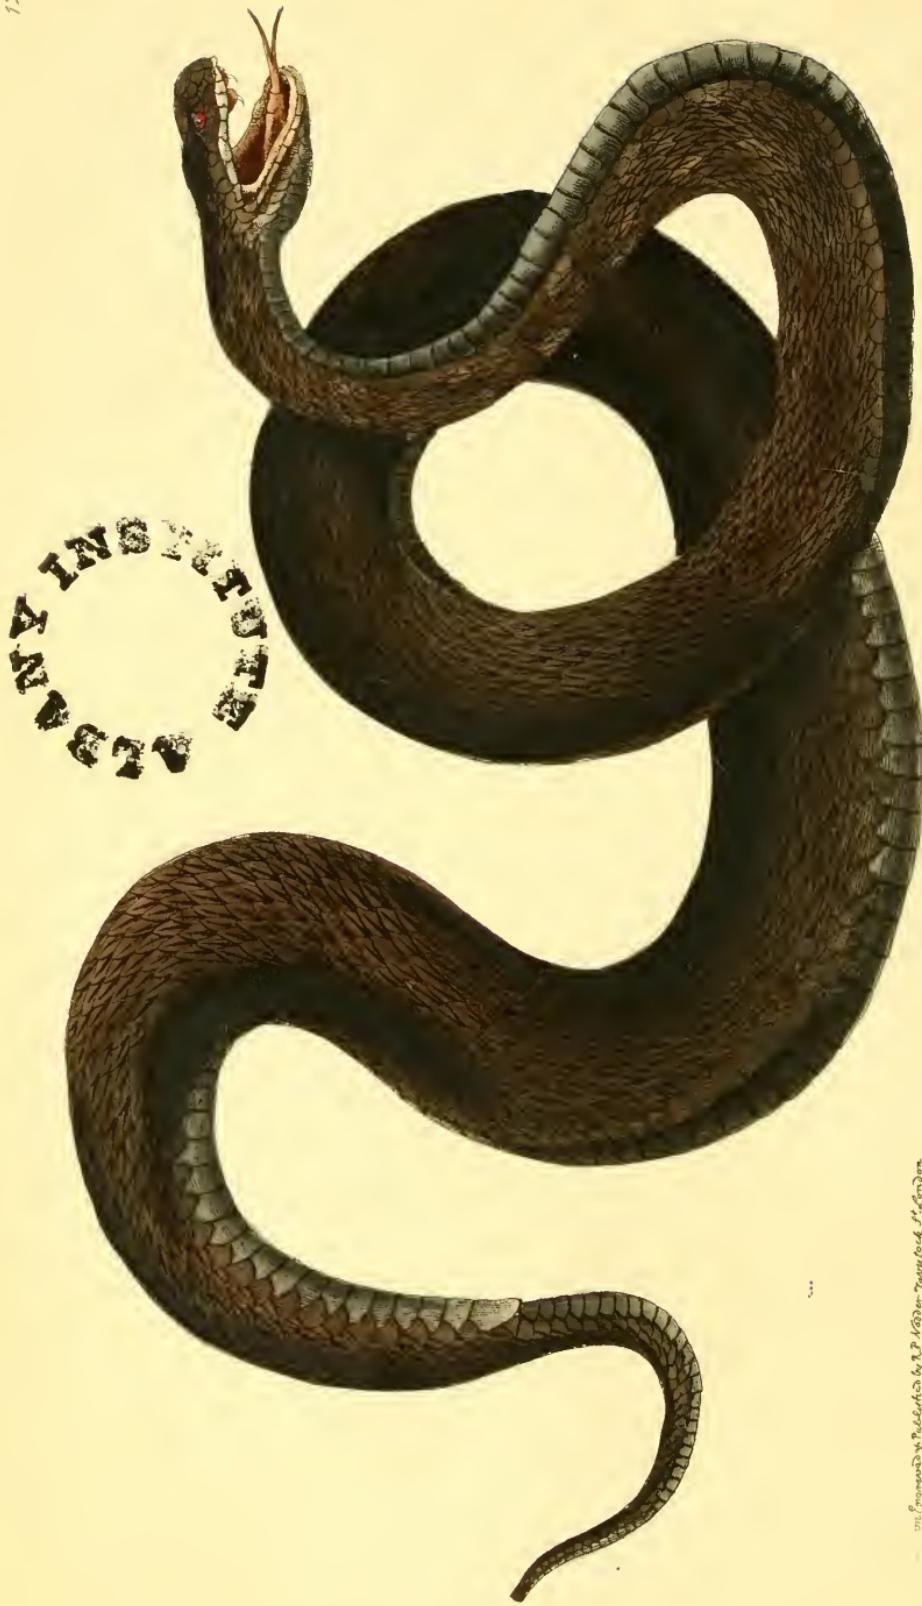

III. Notice of a Variety in the common Corvorant.

PHALACROCORAX CARBO.

It will be very unnecessary to mention the comparative marks by which the Corvorant is distinguished from the genus Pelican, with which it was arranged by Linné, although it had been well characterized by Brisson and other naturalists. My object is merely to call the attention of naturalists to the curious fact recorded by Montagu in the Supplement to his Ornithological Dictionary; namely, that the curious bird figured in the annexed plate is no more than a variety of the common Corvorant.

Montagu received, from Mr. Anstice of Bridgewater, a living specimen of the variety figured (Tab. 123.), and kept it for nearly two years, during which time it entirely lost the white on its throat, neck, and thighs, and assumed the plumage of the common sort; it is therefore proved incontestably to be but a variety of the *Phalacrocorax Carbo*, a species too well known to require any further notice in this place.

IV. *On the Characters of the Common Viper.*

VIPERA COMMUNIS.

This animal is found over the greater portion of the temperate parts of Europe, and is subject to such great differences in colour, that its varieties have been described as distinct species by several authors. I was led to suspect this to be the case at a very early period, and have therefore taken every opportunity of collecting specimens of each variety, with a view to clear up all doubts on the subject. During a long residence in the Western Isles, where this animal is found in the greatest profusion, I obtained a series of the intermediate varieties that most satisfactorily connect all the supposed species, and prove them to be but one,—of which the following is the character:

Vipera communis,

Squamis dorsalibus ovatis, linea elevata longitudinali : squamis lateralibus inferioribus simplicibus subangulatis. Color cinerascens, griseus aut rufescens, lateribus nigromaculatis ; maculis utroque in lineam longitudinalem digestis, dorso linea nigra utrinque serrata, (e maculis rhomboidalibus confluentibus effecta) ; squamis ventralibus subcaudalibus intense plumbeis, rarius pallido-irroratis.

Variat dorso lateribusque intensè nigris aut perfuscis.

Huic speciei referendæ sunt species sequentes : Coluber, 1. Berus, 2. Chersea, 3. Aspis, 4. Prester *Linnæi*, 5. cæruleus, *Shepp.* (*Trans. Linn. Soc. 7, 56.*), et 6. rufescens aut rufus *Museorum Britanniarum*.

In plate 124 will be found a representation of that rare variety named *Prester* by Linné.

The number of scuta and squamæ, on which the specific characters of serpents were founded by Linné, vary in almost every individual of this and of every other species of serpent; and any one may satisfy himself as to the truth of this remark, by counting the number in a brood of the common snake of Britain, *Coluber Natrix*.

ALB. 125
M. T. A.

V. A Notice concerning the Gigantic or Great Frog of Pennant.

TAB. 125.

Naturalists frequently request me to show them the animal mentioned by Pennant in his Voyage to the Hebrides, p. 170, under the name of Gigantic Frog, and in his British Zoology as the Great Frog. In the first-mentioned work he refers it to the *Rana Bombina* of Linné, but in the other he gives no synonym whatever.

When I visited Arran, I made it a point to catch every animal of the family that occurred; and during my stay at Loch Ranza examined, in one evening, nearly six hundred that were taken by Mr. Hanson and myself on the shore of the salt-water lake. Amongst them, several varieties in colour were observed; many of which agreed so well with Mr. Pennant's description, as to satisfy me perfectly that we had found the animal in question, differing in no respect from the common Toad (*Bufo vulgaris*), which occurs in every part of Great Britain in tolerable abundance, especially in the moist woods of Devon and Cornwall; but nowhere in such plenty as in the deep glens of Arran, particularly near Ben-Ghaoil, and in the northern parts of that island.

The one figured was taken at Ranza; it has been compared with specimens collected in various parts of Great Britain, and differs in no respect from them.

VI. Leptocephalus, its Generic Characters, with a Description of one Species.

LEPTOCEPHALUS.

LEPTOCEPHALUS, Gronov., Penn., Cuv., &c.

Corpus compressum, elongatum: Caput parvum; Os dentibus acutissimis tenuibus distantibus instructum.

Pinnæ pectorales parvæ; dorsalis et analis ad caudam coalitæ.

Obs. Corporis latera lineis angulatis impressis notata.

This genus is so little known to naturalists in general, that its existence has often been questioned. It was first discovered by Pennant, who sent it to Gronovius, by whom it was named *Leptocephalus**.

Sp. 1. *Leptocephalus Morrisii.*

L. ventre et lateribus utrinque linea e punctis nigris distantibus confecta notatis.

Leptocephalus Morrisii. Penn. Brit. Zool. 3. 158. p. 67.
Cuv. Reg. Anim. 2. 238.

Habitat in Europæ mari in æstuaria intrans.

* Amongst the animals discovered by the zoologist to the Congo expedition, two species of a genus nearly allied to *Leptocephalus* occur. Their head is smaller and more pointed: rudiments only of the dorsal and anal fins appear at the tail; and no pectoral fins can be discovered. Their bodies are more compressed, but are marked in the same manner with impressed zigzag lines, and the teeth are the same.

ESTATE
IN
THE
CITY
OF
NEW
YORK

Pennant received his specimen of this fish from Mr. W. Morris, who found it in the sea near Holyhead. Our figure is taken from one of two individuals that were caught near Bridgewater by Mr. Anstice, and sent by him to Mr. Montagu.

The eyes still retain a considerable portion of that blue teint which was very strong whilst the animals were alive.

VII. On the Characters of Matuta, with Descriptions of the Species.

MATUTA.

MATUTA, *Dald.*, *Fabr.*, *Lam.*, *Latr.*, *Bosc*, *Leach*.

Testa subrotundata, utrinque spina elongata instructa.

Orbita postice bicrenata.

Oculi pedunculo haud crassiores: articulo secundo basi abrupte incrassato.

Mandibulæ edentulæ.

Antennæ interiores in foveolis transversis inter oculos et clypeum reflectendæ.

exteriorcs brevissimæ sub interioribus insertæ.

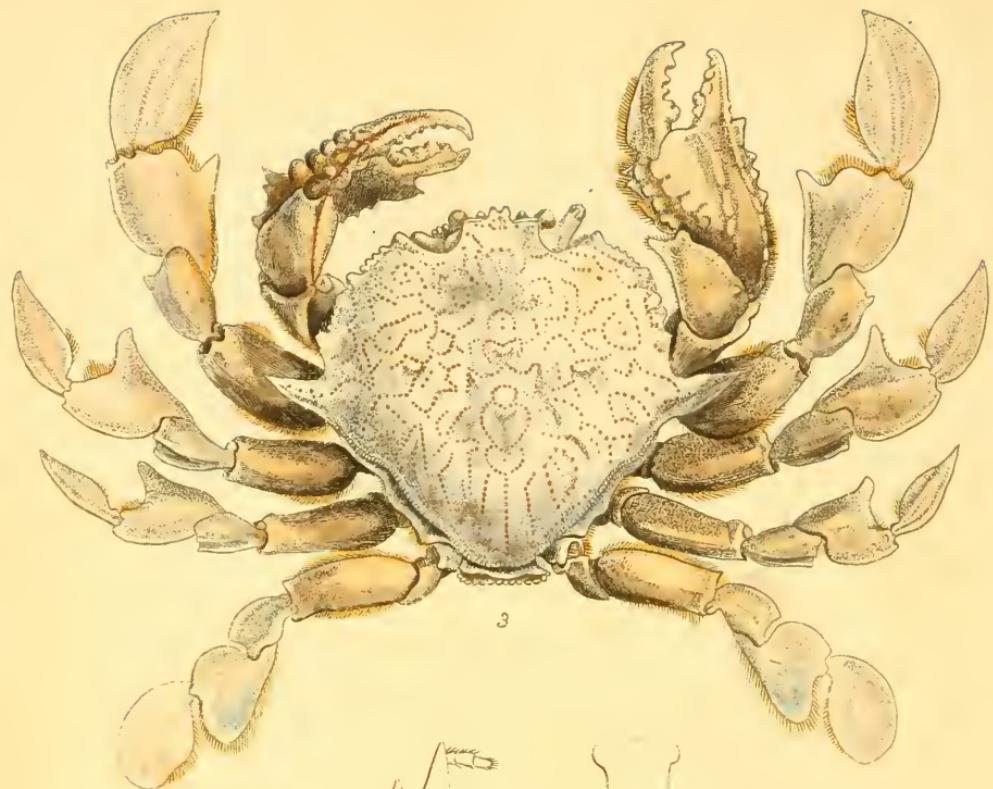

Pedipalpi externi caule interno sensim acuminato articulo secundo intus excavato palpigero: caule externo abbreviato acuminato.

Pedum par anticum subcristatum didactylum; paria 4 postica valde compressa natatoria; tertium et quartum ungue tenuiore instructa.

Abdomen 7-articulatum; *MARIS* articulis 3, 4, 5, coalitis: *Fœminæ* articulis 4 et 5 latioribus.

OBS. Femora quatuor postica articulo secundo saltem subtus spinoso. Manus extus tuberculatæ aut spinosæ. Pedipalpi externi basi saltem granulati.

The type of this genus is *Matuta Victor* of Fabricius; but as the characters which distinguish the species are very obscure, and very accurate figures are necessary, it will not be prudent to refer to any of those given by Herbst and other authors.

Sp. 1. *Matuta lunaris.*

TAB. 127. Fig. 3—5.

M. testa disco 6-tuberculato : tuberculis 2, 3, 1, dispositis ; duobus mediis majoribus, manibus supra et externe tuberculatis, pollice linea elevata polita transversim tenuissime striata, tibiis tertiiis et quartis articulo primo superne bicarinatis.

Matuta lunaris. *Lam. Cat. du Mus. d'Hist. Nat. MSS.*

Fig. 4. Maris abdomen : 5. Pedipalpus externus.

Habitat ad littora insulæ Isle of France vulgatissime.

The elevated granulated margin that is found on the hinder part of the shell in all the species, in this one reaches to the base of the lateral spine, and has on it a tubercle. The lateral spines in all the specimens that I have examined turned forward.

Sp. 2. *Matuta Peronii.*

TAB. 127. Fig. 1—2.

M. testa disco 6-tuberculato : tuberculis 2, 3, 1, duobus anticis obsoletis, manibus supra tuberculatis extus spinosis ; pollice simplici, tibiis tertiiis articulo primo bicarinatis, quartis acute unicarinatis.

Fig. 1. Fœmina : 2. Ejusdem abdomen.

Habitat in mari Indico.

The lateral spines are generally bent a little backwards, but are sometimes perfectly straight. The posterior granulated margin terminates in a tubercle, and does not reach to the base of the lateral spine. The exterior side of the hands has three spines, the middle of which is the longest.

Sp. 3. *Matuta Lesueurii.*

M. testa disco 4-tuberculato : tuberculis 3, 1 ; postico majore, manibus externe spinosis, superne tuberculatis ; pollice linea elevata polita transversim fortissime exarata, tibiis tertii articulo primo superne bicarinatis, quartis acute unicarinatis.

Habitat in Australasiæ mari.

Mus. Hist. Nat. Gallic., Latreille, Nost.

The external side of the hands has two spines, the anterior of which is the largest. The granulated hinder margin does not reach to the spine, but terminates in an elevation. The lateral spines are straight, or slightly inclined forwards.

Sp. 4. *Matuta Banksii.*

M. testa disco tuberculis sex æqualibus fortioribus 2, 3, 1 ; manibus supra tuberculatis, extus spinosis ; pollice linea polita elevata apice transversim tenue exarata, tibiis tertii quartisque superne bicarinatis : his carina postica obsoletissima.

Habitat

Mus. Hist. Nat. Gall., et Nost.

A short distance behind the lateral spine is a very strong tubercle, in which the granulated margin terminates. Three spines are found in the outer part of the hand ; of these, the middle is the largest. The lateral spine is generally horizontal.

I have said nothing of the colour, when speaking of the species, since each is subject to such variety that it ceases to be a character. *Matuta lunaris*, of which I have seen about eighteen specimens, is the only one that is constant in this character.

VIII. *Characters of Micippa, a new Genus of Brachyurous Malacostraca, with Descriptions of two Species.*

MICIPPA.

Testa granulosa (lateribus saltem spinosis) elongato-subquadrata antice rostro elongato-subquadrato abrupte deflecto terminata.

Orbita postice fissura profunda.

Oculi elongato-ovati pedunculo subcurvato subelongato haud crassiores.

Antennæ interiores in foveolis longitudinalibus receptæ; foveolis interne confluentibus.

exteriores mediocres; articulis duobus basilari-
bus majoribus; primo longiore; tertio ex ar-
ticulis elongatis confecto.

Pedipalpi externi articulo primo interne serrato; secundo ad latus internum emarginato palpigeri: palpi articulo tertio elongato aciculiformi; articulo primo crassiore in-
verse subconici.

Pedes mediocres: paria octo postica ordine 2, 3, 4 et 5: unguis arcuati acenti apice nudi: digitis interne tenuissime serrulatis; pars antica MARIS breve, aliis haud crassius; digitis interne tenuissime serrulatis: FEMINÆ aliis tenuius; digitis interne tenuissime serrulatis.

Abdomen 7-articulatum: MARIS obtuse carinatum; articulo primo angusto; articulis 2 et 3 abrupte latioribus: articulis sequentibus abrupte angustioribus; ultimo apice rotundato,

The singular form of the rostrum (at the base of which on each side the external antennæ are inserted) will distinguish this from any other genus of the family *Maiidea* to which it belongs. The two following species only have hitherto been observed.

Sp. 1. *Micippa cristata*.

TAB. 128.

M. testa orbita lateribusque spinosis, dorso medio spinis 2, 3, 1, 4 et 6, rostro acutissime emarginato utrinque spinoso.

Cancer cristatus. *Linn. Syst. Nat.* 1046?

Maïa cristata. *Lam. Catal. du Mus. d'Hist. Nat. MSS.*

Fig. 2. Abdomen maris. 3. Pedipalpus. 4. Rostrum a fronte visum.

Habitat

Mus. Hist. Nat. Gall.

Fig. 1. M. cristata mas mag. nat. 2. Ejusdem abdomen, 3. Rostrum et antennæ a fronte visæ.

Linné refers to a figure in Rumphius (*tab. 8. f. 1.*) for his *Cancer cristatus*; but I am by no means certain that it is the same with Lamarck's *Maïa cristata*.

Sp. 2. *Micippa Philyra*.

M. testa lateribus irregulariter spinosis, rostro acute emarginato utrinque spina recurva armato, manibus glabris.

Cancer Philyra. *Herbst tab. 58. fig. 4.*

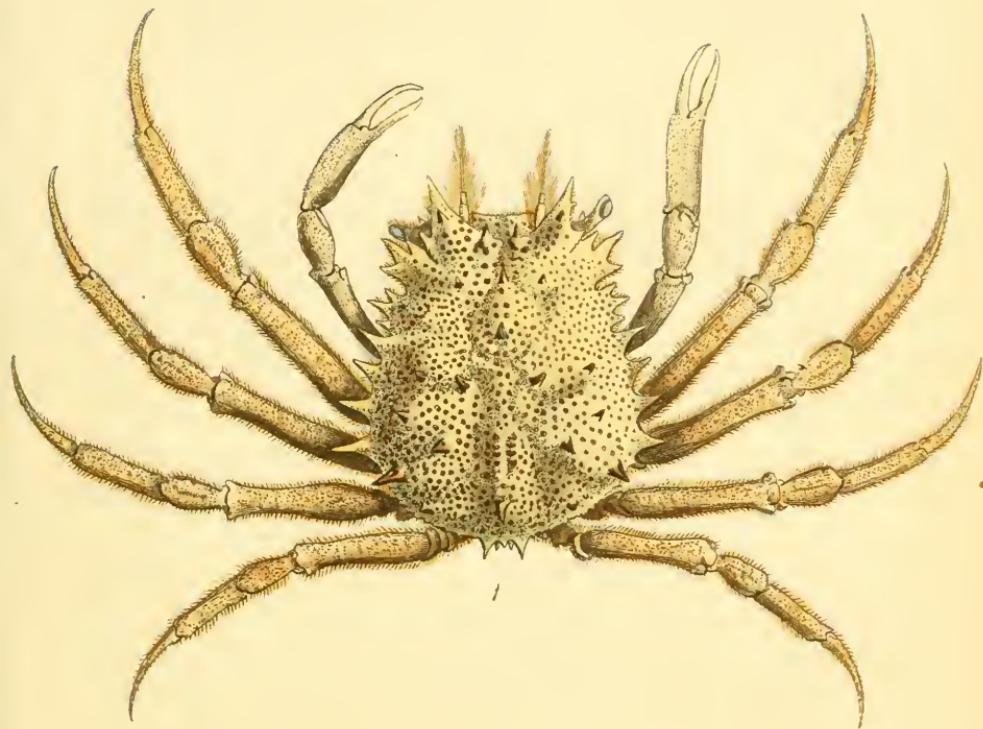

Maïa Philyra. *Lam. Cat. du Mus. d'Hist. Nat. MSS.*

Habitat in Indiae mari.

IX. *Monograph on the Genera and Species of the Malacostracous Family Leucosidea.*

LEUCOSIDEA.

Testa valde indurata convexa subovata rotundata rhomboidalis aut transversissima antice subproducta.

Oculi minimi frontales.

Antennæ externæ minutissimæ in oculorum cantho interiore insertæ :

internæ mediocres in foveolas obliquo-transversas inter oculos recipiendæ.

Pedipalpi externi caule interno sensim acuminato ; articulo secundo interne palpigero :

caule externo flagro nullo instructo, interne longitudinaliter excavato.

Pedes decem : par anticum æquale didactylum, MARIS illo FEMINÆ longius ; paria alia ambulatoria, ungue simplici instructa.

Abdomen in utroque sexu 7-articulatum ; articulis mediis confluentibus :

MARIS angustum a segmento tertio sensim acuminatum :

FEMINÆ amplissimum medio latius ; articulo ultimo parvo penultimo abrupte angustiore.

This family of *Malacostraca* has for its distinguishing characters, a convex very hard shell ; eyes small and frontal ; external antennæ very minute, placed at the internal corner of the eyes ; anterior pair of legs didactyle, the rest

formed for walking; abdomen seven-jointed, with the intermediate joints coalescing, and often obsolete; of the male narrow; of the female very large, with the last joint very small.

SYNOPSIS STIRPIUM ET GENERUM.

Stirps 1. Testa rhomboidalis. Pedum par anticum depresso, aliis multo majus; digitii deflexi.

Gen. 1. **EBALIA**. Testa antice producta; lateribus integris. Brachia antica subangulata; digitis subdeflexis. Pedes octo postici simplices. Pedipalpi externi caule externo linearis. Abdomen MARIS articulo ultimo basi processu dentiformi instructum.

Gen. 2. **NURSIA**. Testa antice producta; lateribus postice dentato-emarginatis. Pedes angulati; digitis valde deflexis. Pedipalpi externi caule externo dilatato. Abdomen MARIS articulo penultimo apicem prope processu dentiformi instructum.

Stirps 2. Testa rotundata aut globosa. Pedum par anticum aliis multo crassius: paria alia articulo penultimo unguibusque compressis.

Gen. 3. **LEUCOSIA**. Testa globosa fronte producta clypeo longiore; lateribus utrinque supra pedes anticos profunde canaliculatis. Pedipalpi externi caule interiore sensim acuminato; exterio latiore linearis.

Gen. 4. **PHILYRA**. Testa rotundata depressa; fronte clypeo breviore. Pedipalpi externi caule interiore acuminato; exterio latissimo ovato.

Gen. 5. **PERSEPHONA**. Testa rotundata depressa; fronte subproducta clypeo non longiore. Pedipalpi externi caulis sensim acuminatis; exterio apice obtusissimo.

Stirps 3. Testa ovata aut globosa; fronte subproducta.

Pedum par anticum filiforme aliis haud valde crassius; manibus apice acuminatis; digitis subfiliformibus: paria alia filiformia simplicia.

Gen. 6. **MYRA**. Testa ovata. Pedipalpi externi caule ex-
tero externe arcuato-producto.

Gen. 7. **ILIA**. Testa sub-globosa. Pedipalpi externi caule
externo apice gradatim angustiore, apice rotundato.

Gen. 8. **ARCANIA**. Testa globosa spinosissima. Pedipalpi
externi caule externo linearis apice interiore emar-
ginato-truncato; interiore gradatim acuminato.

Gen. 9. **IPHIS**. Testa rotundato-rhomboidalis utrinque
spina elongata instructa. Pedipalpi externi caule ex-
teriore sublineari apicem versus sensim angustiore.

Stirps 4. Testa transversa lateribus in cylindrum producta.

Pedes filiformes; par anticum aliis vix crassius; digi-
tis filiformibus.

Gen. 10. **IXA**. Pedipalpi externi caule exteriore breviore
latiore linearis, apice rotundato; interiore articulo se-
cundo antice excavato.

DESCRIPTIONES ET SYNONYMA SPECIERUM.

Gen. I. **EBALIA**.

Sp. 1. *Ebalia Pennantii*.

E. testa granulata cruce irregulari elevata, ab domine arti-
culis 3—6 coalitis.

Cancer tuberosus. *Penn. Brit. Zool.* 4, 8. t. 9. A. f. 19.

Ebalia Pennantii. — *Leach Malac. Podoph. Britt. tab.*
xxv. f. 1—6. ♂ & ♀.

Habitat in Angliae Occidentalis aestuariis.

Sp. 2. *Ebalia Cranchii.*

E. testa granulata carinata tuberculis quinque; ordine 2 approximatis, 2 distantibus, 1 medio majore: abdomine maris articulis 3—5, *fæminæ* 4—6 coalitis.

Ebalia Cranchii. *Leach Malac. Podoph. Britt.* t. 25, f. 7—11. ♂ & ♀.

Habitat in Angliæ Occidentalis mari profundo.

Sp. 3. *Ebalia Bryerii.*

E. testa leviter granulata, antice subcarinata, tuberculis tribus ordine 2—1 (*fæminæ* tumidis); abdomine maris articulis 3—5 et 6—7, *fæminæ* 4—6 coalitis.

Cancer tuberosa. *Mont. Trans. Linn. Soc.* 9. 86, t. 2. f. 3. ♀ aucta.

Ebalia Bryerii. *Leach Malac. Podoph. Britt.* t. xxv. f. 12—13. ♀.

Habitat in Angliæ Occidentalis mari profundo.

Gen. II. NURSIA.

Sp. 1. *Nursia Hardwickii.*

N. testa utrinque 4-dentata, medio tuberculis tribus triangulum delinientibus, postice linea elevata transversa tuberculum gerente, lateribus utrinque 4-dentatis, fronte producto 4-fido.

Long. test. $6\frac{1}{2}$, lat. 8 lin.

Mus. Brit. et Soc. Linneanæ.

Habitat in Oceano Indico. Dom. Hardwicke.

Abdomen maris articulis 3—6 confluentibus.

Gen. III. LEUCOSIA.

X. *On the Characters of the Genus Thalassina of Latreille, with a Description of one Species.*

THALASSINA.

THALASSINA. *Latreille, Leach.*

Antennæ in eadem fere linea horizontali insertæ :

interiores articulis duobus subæqualibus : pedunculus magnus antenna longior : setæ duæ inæquales ; interiore breviore, tenuiore.

exteriores articulis tribus primis elongatis ; secundo longiore : seta multi-articulata elongata.

Pedipalpi externi caule interno 5-articulato piloso ; articulo primo longiore spinuloso ; articulis aliis inermibus.

Pedum paria duo antica didactyla : digitis interne denticulatis ; pollicibus abbreviatis : (pari antico maximo inæquali ; pari secundo submonodactylo valde compresso, supra ac infra piloso :) paria 3 et 4 compressa ; unguis subtus spinosi ; par 5 simplex ; unguis inermis.

Testa compressa antice rostrata, postice producta.

Abdomen 7-articulatum : articulo primo aliis altiore ; articulis 2, 3, 4, 5, et 6 lateribus inferne marginatis : articulo 7 elongato magno, lamellis duabus angustis linearibus in pedunculum subgibbosum insistentibus utrinque instructo.

This genus inhabits the Indian seas ; and although the characters are so very peculiar, yet it has been confounded with **GEBIA**, a genus found in the Red and Mediterranean seas and European ocean.

I have seen but one species of *Thalassina*, but possess a drawing of another, which was given to me by Col. Hardwicke, who informed me that it was designed by a native of India, from a specimen which he gave to him for that purpose.

Thalassina Scorpionoides.

TAB. 130.

Th. rostro marginato : margine antice granulato, femoribus superne simplici infra duplice serie spinosis, manibus granulatis supra bicarinatis : carina interiore spinosa ; exteriore granulosa.

Astacus Scorpionoides. *Lam. Catal. du Mus. d'Hist. Nat. MSS.*

Thalassina Scorpionoides. *Latr. Gen. Crust. et Insect. Leach Edinb. Encycl. 6.*

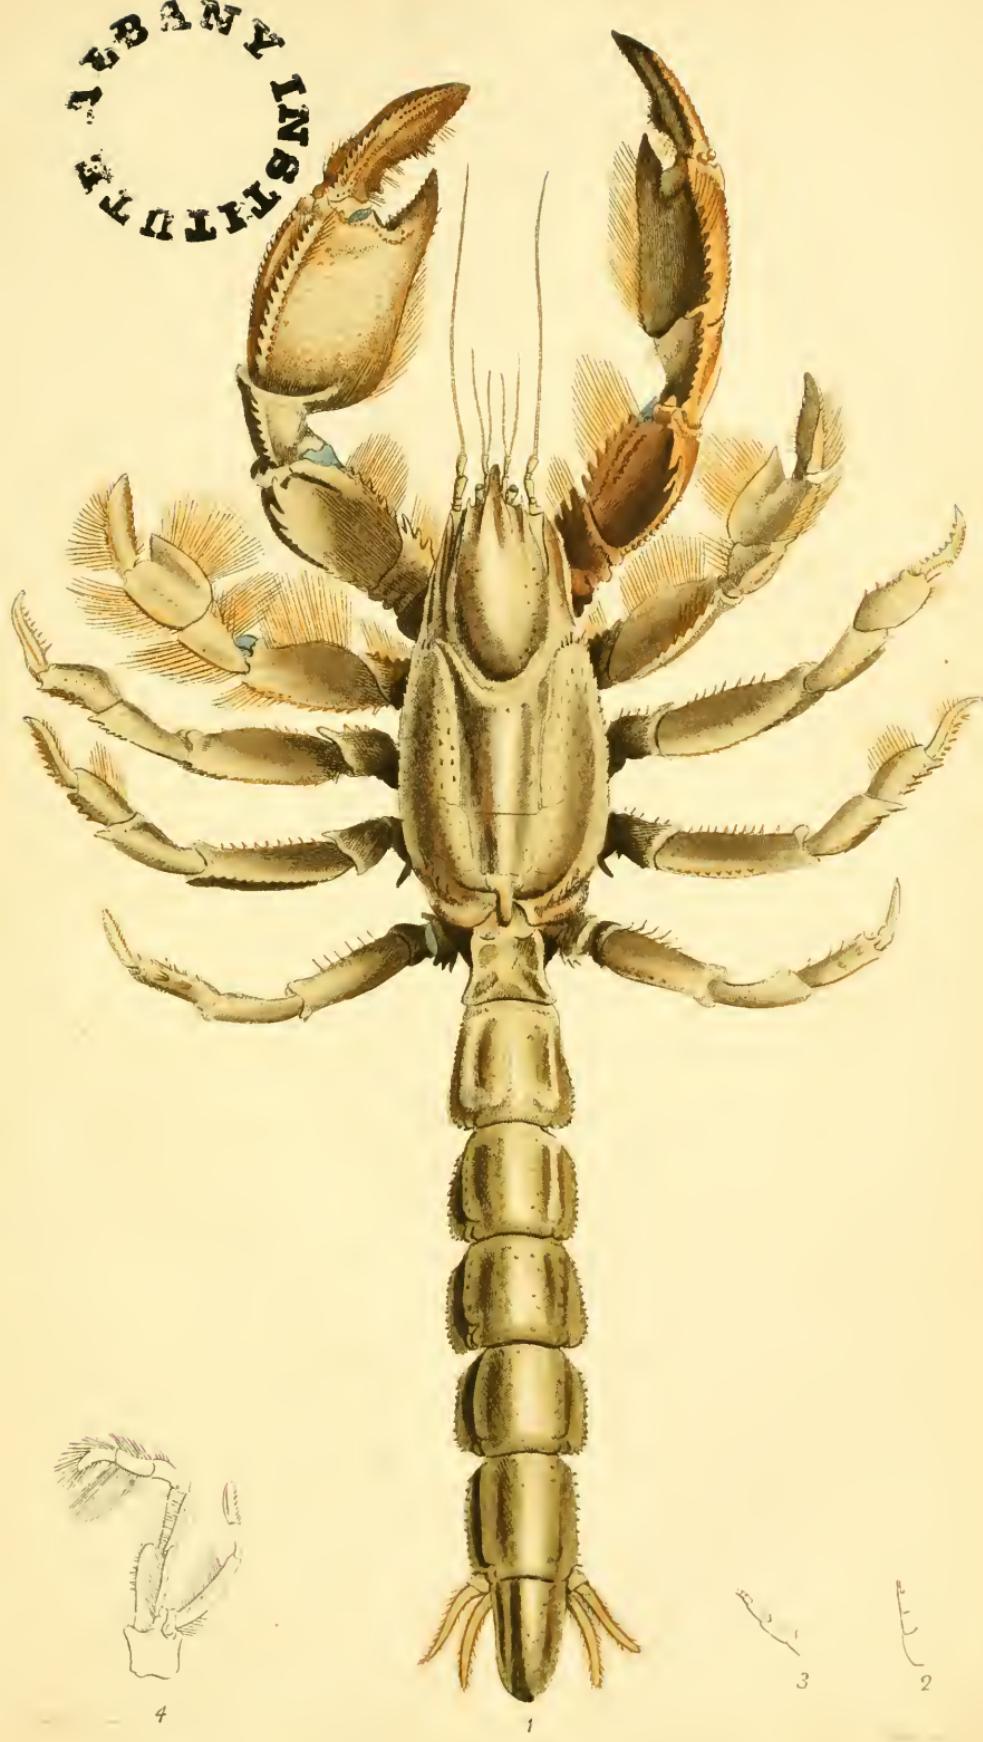

Cancer ASTACUS anomalus. *Herbst Drit. Band. 45. t. 62.*
Fig. 2. Antennæ interioris basis. 3. Antennæ exterioris basis. 4. Pedipalpus.

Habitat in Indiae mari.

Mus. Hist. Nat. Gall. et Collegii Reg. Chirurg. Lond.

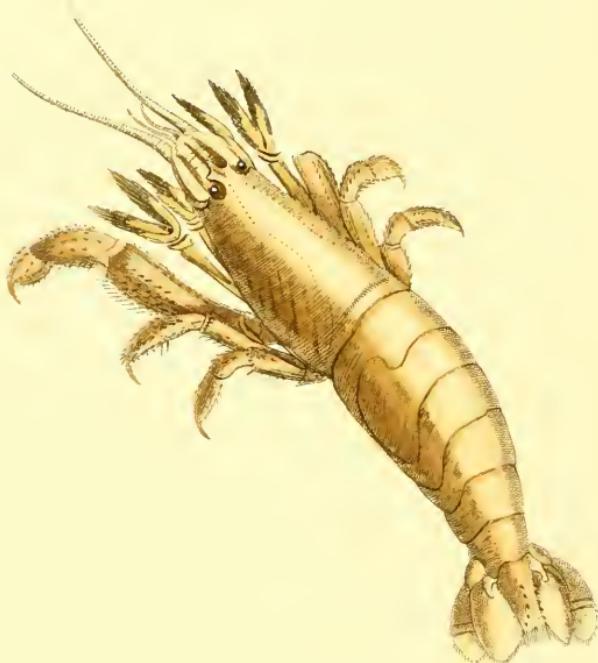

I have figured this species to enable those naturalists who have not seen the genus *Thalassina* to compare it with *Gebia**, with which it has lately been arranged by Latreille in Cuvier's *Regne Animale*.

XI. On the Characters of the Genus *Atya* of Leach,
with a Description of one Species.

ATYA.

ATYA, Leach.

Antennæ interiores setis duabus in eadem linea horizontali
insertis instructæ.

exteriores corporis fere longitudine infra inferiores
insertæ, ad basin squama magna externe uni-
dentata instructæ.

Pedipalpi externi articulo ultimo breviore; flagrum elongatum.

Pedum paria duo antica æqualia articulo penultimo brevisimo: articulo ultimo fisso; laciniis æqualibus apice ciliis longis instructis: par tertium magnum inæquale ungue brevissimo instructum: paria duo postica ungue mediocri instructa.

Cauda lamellis exterioribus bipartitis.

The very curious structure of the four anterior pairs of legs will at once distinguish this from any other genus yet discovered.

It forms a peculiar subdivision of the Shrimp family, and one species only is known.

Sp. 1. *Atya scabra*.

TAB. 131.

A. rostro carinato trifido: dente medio longiore, pedibus sex posticis scabris.

Atya scabra. *Leach Trans. Linn. Soc.* 11. 345.

— *Encycl. Brit. Suppl.* 1. 421. *tab.* 21.

Habitat

Mus. Britan.

The locality of this species is unknown.

XII. *The Characters of the Genera of the Class Myriapoda, with Descriptions of some Species.*

MYRIPODA.

CHARACTER EXTERNUS.

Caput antennis 2: mandibulis 2: maxillis 4 confluentibus in labium inferius transformatis.

Corpus multi-articulatum; segmentis omnibus pedigeris.

OBS. Pedum paria 2 antica s^epe in labia 2 auxiliaria transformata.

It is to the researches of Savigny that naturalists are indebted for a knowledge of the change of form in those parts which always exist under various modifications, in the mouths of such annulose animals as have jointed legs.

The three anterior segments of the body of the *Myriapoda* seem to correspond with the thorax of insects. This idea was suggested to me by Blainville, Latreille, and Savigny, and has received a strong degree of probability from the observations that I have since had an opportunity to make.

In *Crustacea*, *Myriapoda*, *Arachnides*, and *Insecta*, the nervous system is very similar: as far as I have observed, the first ganglion always receives nerves from the parts proper to the head; the three following ones, from the three anterior pairs of legs and parts adjacent; and the rest, from the viscera of the abdomen and its appendices.

Before the publication of Savigny's Memorial on the Mouths of Insects, &c. naturalists had fallen into many

errors respecting the structure of the mouths of the *Myriapoda*.

As formerly, I consider this Class to consist of two Orders, and of the following Genera, &c.

Ordo I. CHILOGNATHA.

Antennæ 7-articulatæ. Pedes breves. Corpus sæpius crustaceum.

Gen. I. GLOMERIS.

GLOMERIS, Latr.

Corpus elongato-ovale convexum in globum contractile.

Oculi distincti. Pedes utrinque 16. Antennæ capitis paginæ supernæ insertæ, articulo secundo tertio breviore.

Sp. 1. *Glomeris marginata.*

MILLER

133

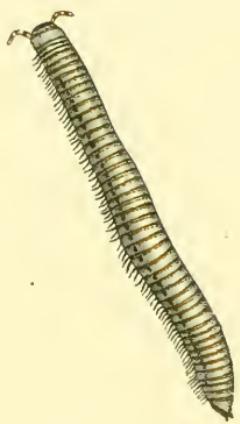

Fig. 133. - Leb. Miller by P.M.

Sp. 1. *Julus sabulosus.*

Jul. nigro-cinereus lineis duabus dorsalibus rufescentibus,
segmento ultimo mucronato, pedibus luteis.

Julus sabulosus auctorum.

Jule à bandes. *De Geer Mem.* 7. 928. *t.* 36. *f.* 9—11.

Long corp. $1\frac{1}{2}$ unc.

Habitat in Europæ sabulosis inter muscos et sub lapidibus.

Corpus longitudinaliter lincolatum, lineis vix subundulatis. Facies flava nigro-punctulata.

This common species may readily be distinguished from all the other indigenous species, by the thickness of its body, by the form of the point of the last segment of the body, and by its colour, which after death changes to a light blueish violet, with testaceous instead of red lines.

Sp. 2. *Julus Londinensis.*

TAB. 133.

Jul. brunneo-nigricans segmento ultimo submucronato: mucrone ano breviore, pedibus rufescentibus articulis pallidis.

Julus Londinensis. *Leach Trans. Linn. Soc.* 11. 378.
— *Encycl. Brit. Supp.* 1. *t.* 22.

Long. corp. $2\frac{1}{4}$ unc.

Habitat in sylvis prope Londinum inter muscos vulgatissime.

Fig. 1. *J. Londinensis* mag. nat. 2. Pes auctus. 3. Antenna amplificata.

Corpus lineolis longitudinalibus tenuissimis rectis exaratum.

After death the body is very often banded with brassy rings.

Sp. 3. *Julus niger.*

J. segmento ultimo mucronato, pedibus pallide rufescen-tibus.

Julus niger. Leach Trans. Linn. Soc. 11. 378.

Long. corp. $1\frac{1}{2}$ lin.

Habitat sub lapidibus. In Calidonia vulgaris.

Corpus fortius lineolatum ; lineolis inæqualibus.

Colour of the body after death blueish.

Sp. 4. *Julus terrestris.*

J. cinereo-fuscus annulis dilute brunneis, capite anoque dilutioribus, ventre pedibusque sublutescente-albis, seg-mento ultimo mucronato.

Julus terrestris auctorum.

Long. corp. 1 unc.

Habitat in Europæ sabulosis, sylvis.

Dorsum striis longitudinalibus rectis exaratum. Pedes arti-culis subfuscis.

The striae are much stronger in this than in the preced-ing species, and the colour is constantly different.

Sp. 5. *Julus punctatus.*

J. segmento ultimo mucronato, corpore sub-pellucido pal-lide subcarneo, segmentorum lateribus postice puncto nigro notatis.

Julus punctatus. Leach Trans. Linn. Soc. 11. 379.

Long. corp. 10 lin.

Habitat in Britannia sub cortice arborum et inter muscos passim.

Sp. 6. *Julus pulchellus.*

J. corpore pallidissime flavescente-albido, lateribus utrinque linea punctorum coccineorum, segmento ultimo inermi.

Julus pulchellus. *Leach Trans. Linn. Soc.* 11. 379.

Long. corp. $7\frac{1}{2}$ lin.

Habitat in Calidoniæ, Angliæ muscis.

Dorsum glabrum striis nullis.

This species is common in the mountainous districts of Great Britain, under moss: it is sometimes found also in gardens at the roots of plants. Some of the segments near the head want the red spots.

Sp. 7. *Julus pusillus.*

J. segmento ultimo submucronato, corpore cinerascente-nigro aut fusco-brunneo, dorso lineis duabus rufescentibus.

Julus pusillus. *Leach Trans. Linn. Soc.* 11. 379.

B. Corpore rufescente lateribus lineaque dorsali fusco-brunneis.

Long. corp. 5—6 lin.

Habitat sub lapidibus et inter graminum radices: Prope Edinburgum et Londinum haud infrequens.

Dorsum lineis fortioribus exaratis, distantibus rectis sub-inæqualibus. Antennæ fuscae articulis dilutis. Pedes lutescentes.

Gen. III. CRASPEDOSOMA.

CRASPEDOSOMA, *Leach.*

Corpus elongatum lineare depresso, segmentis lateraliter marginatis compressis. Oculi distincti. Pedes plurimi.

Antennæ capitis paginæ supernæ insertæ, articulo secundo tertio breviore.

* *Segmentis lateribus medio prominulis.*

Sp. 1. *Craspedosoma Rawlinsii.*

I received several specimens of this animal from Madeira, through the kindness of Mrs. Morshead, who informed me that they were very common in the houses. As I have never seen the *Scutigera araneoides* of Latreille, and as the specimens which I have, will neither agree with the figures nor descriptions of authors, I feel myself justified in considering them as referable to another species.

Gen. II. LITHOBIUS.

Antennæ conico-setaceæ ; articulis (45 circiter) subconicis ; duobus basilaribus majoribus. Pedes 34 posticis longioribus ; femoribus secundis confluentibus, expansione lamelliformi medio late emarginata, valde denticulata. Oculi granulati.

Sp. 1. *Lithobius forficatus.*

Gen. V. GEOPHILUS.

GEOPHILUS, Leach.

Antennæ 14-articulatae cylindraceæ aut apicem versus sensim angustiores; articulis cylindraceis aut basi paululum angustioribus. *Pedes* plurimi; par secundum femoribus expansionibus laevitatis formibus connatis antice vix fissura divisis; par ultimum aliis vix longius. *Oculi* obsoleti.

* *Antennæ articulis brevibus.*

Sp. 1. *Geophilus carpophagus.*

G. capite antennis anoque fulvescentibus, corpore violascente antice flavicante, pedibus pallide subflavis.

B. corpore obscure subviolascente-testaceo antice subtestaceo.

Geophilus carpophagus. Leach Trans. Linn. Soc. 11. 385.
— Encycl. Brit. Supp. 1. 431.

Long. corp. 2—2½ unc.

Habitat in Angliæ hortis passim, fructibus victitans. Scolopendram electricam auctorum esse putat Clariss. J. Banks.

Caput flavum, fulvo varium; antennæ fulvescentes, articulis apice pallidis. Dorsum antice flavicans linea longitudinali flava utrinque violascente, parte ante medium usque ad segmentum ultimum violascente, linea longitudinali pallida; latera pallida linea undulata sinuosa cinereo-violascente. Venter dorsi coloris absque lineis marginalibus, parteque violascente pulcherrime colore saturatiore maculata. Pedes subflavi pallidi articulis saturationibus, unguibus nigris.

Variat parte antica concolore, pedibusque posticis longioribus. Forte sexus alter.

Sp. 2. *Geophilus subterraneus.*

G. corpore flavo, capite ferrugineo.

Scolopendra subterranea. *Shaw Trans. Linn. Soc.* 2. 7.

Geophilus subterraneus. *Leach Trans. Linn. Soc.* 11. 385.

— *Encycl. Brit. Supp.* 1. 431.

Long. corp. $3\frac{1}{2}$ unc.

Habitat in Angliae hortis.

Dorsum segmentis lateraliter prominulis, lineis duabus longitudinalibus abbreviatis impressis. Pedes articulis subferrugineis, unguibus nigricantibus.

In the living state, this species (which is extremely common in gardens in the western counties of England) may readily be distinguished from the preceding species by the longitudinal abbreviated lines.

In January, I observed beneath the earth in a garden, a cavity containing a female and twenty-six young ones*; they were of a pale yellow colour, with their heads darker yellow, and the joints of their legs slightly ferruginous.

Sp. 3. *Geophilus maritimus.*

TAB. 140. Fig. 1—2.

G. linearis brunneo-ferrugineus, capite antennisque ferrugineis, pedibus fusco-luteis.

Ocelli 8.	- - - -	4. BUTHUS.

Stirps 1.

The ocelli of the animals of this division are placed on the sides of the anterior segment of the body or thorax. They want the tail and the pectinated processes near the base of the abdomen, by which they may very easily be distinguished from those of the second stirps, with which they were formerly arranged by Fabricius, under the title *Scorpio*. Two species only were known to Linné, who re-

* *Scorpio Europæus auctorum.*

ferred them to his artificial Genus *Phalangium*. The greater number of the species live beneath the bark of decaying trees or under stones; but one at least is parasitical, and attaches itself to the legs of flies.

Latreille believes that they breathe by tracheæ, and therefore refers them to the second order of his *Arachnides*. See *Cuv. Reg. Anim.* 3. 108.

Communicavit Dom. C. Prideaux.

Color livido-fuscus, pedibus 4 anticis pallide ferrugineis; 8 posticis pallidis.

Thorax antice nonnunquam ferrugineus.

Stirps 2.

The nervous system of the animals composing this stirps consists of eight ganglia, brought into communication by two nervous cords, which are generally confluent between the hindermost ganglia. The first ganglion is situated behind and above the origin of the first pair of legs; it is larger than the others, and its hemispheres are well defined; it receives the optic nerves as well as nerves from the direction of the first branchiae: the three following ganglia are abdominal, and distinctly receive nerves from the branchial regions: the other four ganglia are placed within the four first joints of the tail; and the last receives nerves from the terminal joint which bears the sting.

In the specimens that I have examined (taken out of alcohol), not the slightest traces of the nerves arising from the viscera and joining the abdominal ganglia as described by Treviranus* and Dufour† could be discovered.

XV. Descriptions of three Species of the Genus
Phthiridium of Hermann.

PHTHIRIDIUM.

PHTHIRIDIUM. *Hermann, Olfers, Leach.*

NYCTERIBIA. *Latreille.*

Thorax depresso antice *os* in dorsum gerens : *pedes* 6 laterales ; *femora* articulis 2, secundo longo compresso ; *tibiæ* articulis 2, primo longiore compresso, secundo gracili arcuato ; *tarsi* articulis 5, tribus primis (gradatim brevioribus) brevibus, quarto longiore apicem versus gradatim latiore, quinto breviore *ungue* didactylo instructo.

Abdomen in utroque sexu 8-articulatum ; (FŒMINÆ? segmento primo dorsali producto, segmenta quatuor sequentia tegente; segmento ultimo utrinque stylo apice setigero instructo : MARIS? segmento ultimo majore.)

OBS. Pectus postice productum recte truncatum; margine setis rigidis brevibus atris dense ciliato.

Habitant Phthiridia in Vespertilionidea inter pilos.

This Genus was established in 1804 by Hermann, who named it *Phthiridium*, and in the following year it was observed by Latreille, who called it *Nycteribia*.

Its situation is extremely doubtful ; it was referred to the *Diptera* by Latreille, who observes in a note that it may probably be found hereafter to constitute a peculiar order of insects. From the want of antennæ, and from the confluence of the head and thorax, I placed it amongst the *Arachnides*, in a division by itself. Its mode of propaga-

Ph. corpore albido, abdomine segmentis lateraliter prominulis.

Pediculus inguinalis. *Redi Exper.* t. 19.

Pediculus pubis auctorum.

Phthirus inguinalis. *Leach Edinb. Encycl.* 9. 77.

Pediculus ferus. *Olfers* 83.

Habitat in hominis pube, grandebulis, villis, superciliis, ciliis, mustacibusque, cuti adhærens.

This animal is commonly named *crab-louse*, or *morpion*.

Gen. II. HÆMATOPINUS.

HÆMATOPINUS. *Leach.*

Sp. 1. *Hæmatopinus Suis.*

TAB. 146.

H. capite antennis thorace pedibusque subfulvescentibus fusco-variis, abdomine cinereo-albido : segmentis lateraliiter prominulis nigris ; ultimo maculis duabus nigris, pectore albido.

Pediculus Suis. *Linn. Syst. Nat.* 1. 1017.

Schrank. Fn. Boic. 3. 2608.

Olfers 86.

Hæmatopinus Suis. *Leach Encycl. Brit. Supp.* 1. *pl.* 24.

Habitat in sue scrofa.

In the annexed plate the insect is represented of its natural size and magnified, with a leg and antenna highly magnified.

Gen. III. PEDICULUS.

PEDICULUS *auctorum*.

Sp. 1. *Pediculus humanus*.

P. abdomine lobato albido subimmaculato.

Latr. Gen. Crust. et Ins. 1. 168.

Pou humain du corps. *De Geer Mém.* 7. 67.

Pediculus humanus *auctorum*.

Pediculus pubescens var. α . *Olfers* 80.

Habitat in hominum vestimentis cute.

This species, which is very common in the warmer parts of Europe, is rare in England. It is called *body-louse* or *tailor's-louse**.

Sp. 2. *Pediculus cervicalis*.

P. abdomine lobato cinereo, utrinque fascia nigra interrupta. *Latr. Gen.* 1. 168.

Pou humain de la tête. *De Geer Mém.* 7. 67.

Pediculus humanus var. *Linn. Syst. Nat.* 1. 1016.

Habitat in capite hominum.

* No naturalist seems to be acquainted with the animal which causes that dreadful disease named *Phthiriasis* or *morbus pediculosus*, described as being incurable.

This is the *head-louse* so common in the heads of children of the lower classes. It may easily be killed by the application of calomel.

Gen. IV. NIRMUS.

NIRMUS. *Hermann.*, *Olfers*, *Leach*.

RICINUS. *De Geer*, *Oliv.*, *Lamarck*, *Latreille*.

It is now almost fully established, that every species of bird has its own peculiar parasite, no instance having occurred, in which one species of *Nirmus* has been found on two different birds, although many birds have two or three species peculiar to themselves. The importance therefore of clear descriptions of these animals is so very important to the ornithologist, that it is to be hoped that every naturalist who has opportunity to investigate the subject, and to describe the species, will not omit to do so.

XIX. *Synopsis of the Stirpes and Genera of the Family Dyticidea.*

DYTICIDEA.

HYDROCANTHARI. *Latreille.*

DYTICUS. *Geoffroy.*

DYTISCUS. *Linné, &c.*

SYNOPSIS STIRPIUM ET GENERUM.

A. *Scutellati.* *Pedes omnes gressorii : tarsis omnibus 5-articulatis ; unguibus didactylis.*

Genera.

Stirps 1. Femora postica basi lamella clypeiformi tecta.

Palpi maxillares externi et labiales subulati - - - - 1. HALIPLUS.

Stirps 2. Femora postica basi libera.
(Oculi prominuli.)

Palpi maxillares externi articulo ultimo subclavato - - - - 2. PÆLOBIUS.

B. *Exscutellati.* *Pedes postici subnata-*
tatorii, aut natatorii.

Stirps 3. Tarsi quatuor antici 4-arti-
culati: duo postici 5-arti-
culati.

Corpus fere globosum. *Tarsi* 4-antici
articulo ultimo brevi: *ungues*
postici monodactyli - - - 3. HYPHYDRUS.

Corpus ovale aut elongatum latitudine altitudinem superans. *Tarsi* 4-antici articulo ultimo gracili: *ungues* omnes didactyli - 4. HYDROPORUS.

Stirps 4. *Tarsi* omnes 5-articulati.

Antennæ articulo quinto aut septimo dilatato. *Pedes postici* subnatatorii - - - - 5. NOTERUS.

Antennæ articulis simplicibus. *Pedes postici* natatorii - - - 6. LACCOPHILUS.

C. *Scutellati.* *Pedes postici* valde compressi natatorii: *tarsi* omnes 5-articulati.

Stirps 5. *Tibiæ posticæ* elongatae: unguis postici didactyli.

Palpi maxillares externi articulis 2 et 3 æqualibus; 4 longiore subulato 7. AGABUS.

Palpi maxillares externi articulis 2 et 3 æqualibus; 4 longiore apice obtuso - - - - - 8. COLYMBETES.

Palpi maxillares externi articulo 2 sequenti breviore; 3 et 4 longitudine æquales, hoc subulato - - - 9. HYDATICUS.

Palpi maxillares externi articulo 2 obconico; 3 elongato-obconico, 4 subcylindrico longiore apice rotundato - - - - - 10. ACILIUS.

Palpi maxillares externi articulis 3 exterioribus æqualibus; ultimo medium versus gradatim dilatato,

apice decrescente oblique subtruncato - - - - -

11. **DYTICUS.**

Stirps 6. Tibiae posticæ breves latissimæ : unguis postici monodactyli.

Palpi maxillares externi articulis 2 et 3 elongato-obconicis : 4 longiore medio externe subdilatato apice recte truncato - - - - -

12. **TROGUS.**

SYNONYMA GENERUM.

Gen. I. **HALIPLUS.**

HALIPLUS. *Latreille, Gyllenhall, Leach.*

CNEMIDOTUS. *Illiger.*

HOPLITUS. *Clairville.*

* *Corpore oblongo-ovali. Elytra carinulata.*

Dytiscus elevatus. Panz. Fn. Ins. Germ. 14. 9.

Gen. II. **PÆLOBIUS.**

PÆLOBIUS. *Schönherr, Leach.*

HYGROBIA. *Latreille.*

HYDRACHNA. *Fabr.*

1. H. Hermanni. *Fabr.*

Gen. III. HYPHYDRUS.

HYPHYDRUS. *Latr., Gyll., Illig., Schönh.*

1. D. ovatus. *Linné.*

Gen. IV. HYDROPORUS.

HYDROPORUS. *Clairville, Latreille, Leach.*

HYPHYDRUS. *Illig., Schönh., Gyll.*

* *Corpore elongato.*

Dytici auctorum: 1. 12-pustulatus, 2. depressus, 3. linneellus, &c.

** *Corpore ovato.*

Dytici auctorum: 1. confluens, 2. trifidus, 3. flexuosus, &c.

Gen. V. NOTERUS.

NOTERUS. *Clairville, Latreille, Leach.*

Sp. 1. *Noterus Geerii.*

N. elytris lineis tribus punctorum impressis.

Dytiscus crassicornis, auctorum.

Dytiscus clavicornis. *De Geer Mém. 4. 402.*

Habitat in stagnis Europæ.

Sp. 2. *Noterus sparsus.*

N. elytris punctis sparsis impressis.

Dytiscus sparsus. *Marsh Ent. Brit. 1. 430.*

Habitat in aquis stagnantibus prope Londinum frequens.

Gen. VI. LACCOPHILUS.

LACCOPHILUS. Leach.

1. *Dytiscus hyalinus* *Marsh.* D. *interruptus* *Panz?* 2. D. *minutus* *Linn.* D. *obscurus* *Panz.* D. *marmoreus* *Oliv.*

Gen. VII. AGABUS.

Antennæ MARIS ad apicem dilatatae compressæ serratae.

Sp. 1. *Agabus Paykullii.*

1. *Dytiscus serricornis*. *Payk.* *Fn. Sv.* 3. 443.

Habitat in Lapponiæ aquis.

Gen. VIII. COLYMBETES.

COLYMBETES. *Clairville, Latreille, Leach.*

Dytisci: 1. *striatus*, 2. *fenestratus*, 3. *carbonarius*, &c.
auctorum.

Gen. IX. HYDATICUS.

HYDATICUS. Leach.

Tarsi antici MARIS articulis tribus basilaribus patellam efformantibus. ♀ *Thorace utrinque ruguloso, elytris lœvibus.*

Dyticus auctorum, 1. *Hybneri* (*parapleurus Marsh*), 2. *transversalis*, 3. *stagnalis*, 4. *vittatus*, 5. *stricticus*, &c.

Gen. X. ACILIUS.

Tarsi antici MARIS articulis tribus basilaribus patellam efformantibus. *Elytra* ♀ *sulcata.*

Dyticus 1. *sulcatus auctorum.*

Gen. XI. DYTICUS.

DYTICUS. *Geoff.*, *Illig.*, *Latr.*, *Leach.*

DYTISCUS *auctorum.*

Tarsi antici in masculis articulis tribus basilaribus patellatis. *Elytra* ♀ sulcata.

* *Elytra margine dilatato.*

1. *Dyticus latissimus.*

** *Elytra margine non dilatato.*

Dytici: 1. *marginalis*, 2. *lapponicus*, 3. *dimidiatus*, 4. *punctulatus*, &c.

Obs. Hujus sectionis feminæ variant elytris sulcis obsoletis aut nullis.

Gen. XII. TROGUS.

Tarsi antici ♂ articulis tribus primis patellatis. *Elytra* ♀ sæpius dense striolata.

1. *Dyticus lateralis*, &c.

XX. On the Natural Characters of Four Genera,
which have been confounded under the Name
Silpha.

SILPHA.

SYNOPSIS GENERUM.

1. NECRODES. *Corpus* elongato-ovale. *Thorax* orbicularis. *Elytra* apice oblique truncata. *Antennæ* gradatim extrorsum crassiores.
2. OICEOPTOMA. *Corpus* ovale. *Thorax* fere semicircularis transversus, antice emarginatus. *Elytra* integra (fœminæ sæpe emarginata). *Antennæ* clava abrupta.
3. SILPHA. *Corpus* ovale. *Thorax* semicircularis antice truncatus. *Elytra* integra. *Antennæ* gradatim extrorsum crassiores.
4. PHOSPHUGA. *Corpus* ovale aut subrotundum. *Thorax* semicircularis postice abrupte truncatus. *Elytra* integra. *Antennæ* articulis tribus ultimis praecedentibus abrupte crassioribus.

SYNONYMA GENERUM.

Gen. I. NECRODES.

NECRODES. *Wilkin MSS.*, *Leach**.

Silpha 1. littoralis, &c.

* *Zool. Misc.* 2. 87.

Gen. II. OICEOPTOMA.

Antennæ articulis 1 et 2 elongatis subcylindraceis - - - - 6. **PSELAPHUS.**

II. Antennæ 6-articulatæ. Palpi maxillares brevissimi.

Sirps 3. Corpus subcylindraceum.

Antennæ articulis 1 et 2 minoribus subglobosis. Palpi maxillares filiformes - - - 7. **CLAVIGER.**

Latreille supposed that these animals had but two joints in their tarsi, and therefore placed them in a peculiar section of the Coleoptera; observing, however, that they are allied to *Aleochara*, a genus of the family *Staphylinidea*, to which faintly they are even referred by Kirby.

I consider them as constituting a distinct family, whose situation is intermediate between the *Staphylinidea* and *Scydmænidea*, to both of which they are intimately allied, but may be distinguished from either by the structure of their claws, and from the latter also by their abbreviated elytra.

The genus *Cleunium* of Latreille I have never seen;

but suspect that it will be found to constitute a family intermediate between *Pselaphidea* and *Scydmænidea*.

Of this family my cabinet contains nineteen British species, five of which are new, and none of them were known to Mr. Marsham, who has not described one species in his *Entomologia Britannica*.

Stirps 1. *

Gen. I. EUPLECTUS.

EUPLECTUS. Kirby *Mss.*

Sp. 1. *Euplectus Reichenbachii.*

Pselaphus nanus, Reich. *Monog. Pselaph.* 69. t. 2. f. 20.

Habitat in com. Norfolciæ rarissime. Communicavit Dom. J. Curtis.

I possess two new species of this genus; but I shall refrain from describing them until I have seen the species mentioned in the note beneath, and which I hope to obtain from my liberal correspondent Mr. Kunzé of Leipsic, to whom I feel much indebted for several species of this interesting family of Coleoptera.

Stirps 2.

Gen. II. BYTHINUS.

PSELAPHI FAM. II. *Reichenbach*, pars.

Antennæ articulo 1 crasso cylindraceo; 2 crassiore, MARIS interne acute producto; articulis 3, 4, 5, 6, 7 et 8 æqualibus lenticulatis; 9 et 10 crassioribus lenticulatis; 11 ovato, apice acutissimo.

* Ad hanc stirpem saltem forte pertinent PSELAPHI Reich. 1. *ambiguus*. 2. *Karstenii*. 3. *signatus*.

Palpi maxillares articulo 1 filiformi, apice gradatim clavato; 2 ovato; 3 ovato securiformi maximo basi angustissimo.

Sp. 1. *Bythinus securiger.*

Pselaphus securiger. Reich. Monog. *Psel.* 45.

Habitat in com. Norfolciæ. Jos. Hooker.

Sp. 2. *Bythinus Curtisi.*

B. saturate badius aut fusco-badius, ore antennis pedibusque rufo-castaneis, thorace capite latiore, elytris punctatis.

Habitat in Norfolcia; sub nomine *Pselaphi binodis* communicavit Dom. J. Curtis. Apud Bexley, prope Londonum ♂ observavit Dom. G. Samouelle, qui mihi communicavit.

Gen. III. ARCOPEAGUS.

PSELAPHI FAM. II. *Reich.* pars.

Antennæ articulis 1 et 2 crassioribus: articulo 1 elongato; 2 subgloboso primo tenuiore; articulis 3, 4, 5, 6, 7 et 8 æqualibus subglobosis; 9 crassiore lenticulari - subgloboso; 10 lenticulari - subgloboso præcedente majore; 11 aliis crassiore ovato apice acuminato.

Palpi maxillares articulo 1 filiformi apice gradatim clavato; 2 elongato-ovato; 3 ovato-securiformi basi angustissimo.

* *Antennæ articulo primo cylindraceo.*

Sp. 1. *Arcopagus glabericollis.*

Pselaphus glabericollis. Reich. Monog. *Pselaph.* 43. t. 1. f. 8.

Habitat in sylvis sub muscis. Prope Londinum rarissime.
 Dom. G. B. Sowerby; prope Bristol haud unfrequens.
 Dom. J. Miller.

Sp. 2. *Arcopagus clavicornis.*

Pselaphus clavicornis. Reich. Monog. *Pselaph.* 40. t. 1,
 f. 7.

Habitat prope Swansea rarius. Dom. S. W. Millard,

* * *Antennæ articulo primo interne dilatato.*

Sp. 3. *Arcopagus bulbifer.*

Pselaphus bulbifer. Reich. Monog. *Pselaph.* 37. t. 1. f. 6.
 Habitat in com. Norfolciæ. Dom. Sims et Jos. Hooker,

Gen. IV. TYCHUS.

PSELAPHI FAM. II. Reich. pars.

Antennæ articulis 1 et 2 crassioribus subcylindraceis : articulo 1 longiore crassiore ; articulis 3, 4, 5, 6, 7 et 8 subglobosis : 1, 3 et 4 paulo longioribus : 5 (MARIS præsertim) crassiore ; 9 et 10 globoso-lenticulatis crassioribus ; 10 majore ; 11 ovato aliis crassiore.

Palpi nondum sedulose examinavi.

Sp. 1. *Tychus niger.*

Pselaphus niger. Reich. Monog. *Pselaph.* 35. t. 1. f. 5. ♂
 a ♀ antenna.

Habitat prope Londinum, Bristol, et in com. Norfolciæ, haud valde infrequens. Var. elytris disco castaneis mihi communicavit Dom. J. Miller.

Gen. V. BRYAXIS †.

BRYAXIS. *Knoch.*

PSELAPHI FAM. III. A. *Reich.*

Antennæ articulis 1 et 2 crassioribus subcylindraceis ; articulis 3, 4, 5, 6 et 7 subcylindraceis : 5 longiore ; 8 subgloboso minore ; 9, 10 et 11 aliis crassioribus.

Palpi maxillares articulo 1 clavato basi angustissimo ; 2 subgloboso ; 3 conico.

* *Thorax foveolis sulco conjunctis. Antennæ articulo ultimo apice acuto ; articulis 3, 4, 5, 6 et 7 elongatis.*

Sp. 1. *Bryaxis longicornis.*

B. antennis articulis 9, 10 et 11 elongatis clavam gradatim efformantibus ; hoc apice acuminato.

Habitat in agris Battersea dictis prope Londinum, inter graminum radices.

Sp. 2. *Bryaxis sanguinea.*

B. antennis articulo 9 ovato ; 10 crassiore subgloboso basi paulo angustiore ; 11 elongato-acuminato.

Pselaphus sanguineus. *Reich. Monog. Psel.* 49.

Habitat in Norfolcia, et in agris Battersea dictis prope Londinum.

** *Thorax foveolis distinctis. Antennæ articulo ultimo apice subobtusato ; articulis 3, 4, 5, 6 et 7 brevibus. (articulo 9 subgloboso ; 10 lenticulari.)*

† Ad hoc genus *Pselaphus insignis* *Reich.*, quem a Dom. Kunzé accipi, pertinet.

Sp. 3. *Bryaxis impressa.*

Pselaphus impressus. *Reich. Monog. Pselaph.* 58. t. 2.
f. 15.

Habitat in com. Norfolciæ. J. Hooker. S. Wilkin.

Sp. 4. *Bryaxis fossulata.*

Pselaphus fossulatus. *Reich. Monog. Pselaph.* 54. t. 2.
f. 15.

Habitat prope Londinum, Copenhagen Fields, et prope
Bexley. Dom. Samouelle.

Sp. 5. *Bryaxis hæmatica.*

Pselaphus hæmaticus. *Reich. Monog. Pselaph.* 52. t. 2.
f. 12.

Habitat sub muscis. In Danmoniæ sylvis prope Ashbur-
ton haud rarius occurrit.

Sp. 6. *Bryaxis Juncorum.*

B. rufescente-castanea cinereo-pubescent, pedibus anten-
nisque dilutioribus, thorace subgibboso; foveolis latera-
libus majoribus; postica minima.

Habitat in juncis. In Norfolcia, Danmonia, et prope
Londinum observavi.

Minor B. hæmatica.

Gen. VI. PSELAPHUS.

PSELAPHUS. *Herbst, Latr., Leach, &c.*

PSELAPHI FAM. I. *Reichenbach.*

Antennæ articulis 1 et 2 elongatis subcylindraceis; articulis
3, 4, 5, 6, 7 et 8 subglobosis æqualibus; 9 et 10
crassioribus fere æqualibus subglobosis; 11 elon-
gato-ovato aliis crassiore.

Palpi maxillares articulo 1 filiformi apice subabrupte clavato; 2 subgloboso; 3 filiformi apice gradatim clavato.

Sp. 1. *Pselaphus Herbstii.*

Pselaphus Herbstii. *Reich. Monog. Psel. 25. t. 1. f. 1.*

Habitat in ripani prope Bristol vulgatissime. Croydon et Godstone prope Londinum semel legi.

Sp. 2. *Pselaphus Hiesii.*

Pselaphus Hiesii. *Reich. Monog. Pselaph. 28. t. 1. f. 2.*

Habitat in Norfolcia. Dom. J. Curtis et Jos. Hooker.

Sp. 3. *Pselaphus longicollis.*

Pselaphus longicollis. *Reich. Monag. Pselaph. 30. t. 1. f. 3.*

Habitat in Norfolcia et Danmonia rarissime.

Sp. 4. *Pselaphus Dresdensis.*

Pselaphus Dresdensis. *Reich. Monog. Pselaph. 32. t. 1. f. 4.*

Prope Bristol semel observavit Dom. J. Miller, qui mihi comunicavit. Ex Austria, sub nomine *P. gibbosicollis Knoch.* a Megerle accepi.

**XXVI. On the distinctive Characters of two Species
of the Fabrician Genus Geotrupes, which have
been confounded under the name of Actæon.**

Volumes might be written on the characters that divide the numerous genera named *Melolontha*, *Geotrupes*, and *Copris*, by authors, and entomologists may expect some valuable observations on this subject from the pens of A. MacLeay, Esq. and of his son W. MacLeay, Esq. both of whom have turned their attention particularly to the examination of them.

I am a warm advocate for generic divisions, (founded on the consideration of every character,) being fully satisfied that such exist in nature, and, when distinguished with judgment, tend materially to the advancement of science. Those entomologists of the Linnean school, who, by dilating the characters either of their genera or species so as to make them admit of almost any thing*, bend Nature to the artificial system of their master, would do well to consider whether they do not show greater veneration for it, than for Nature, and not to upbraid those who hold a different opinion from themselves.

Every entomologist, who has turned his attention to the study of exotic Coleoptera, knows that the female of *G. Actæon* of Fabricius is described as having crenate or irregularly sculptured elytra, and a bidentate clypeus. The latter

* For an example of this, see the altered character of the genus *Limax*, in the Introduction to Montagu's *Testacea Britannica*.

character is common to all the females of the same group with *Actæon*, and the former character is most probably as universal *.

Having once seen a female variety of *Actæon* with smooth elytra, I was induced to suppose that there were probably two species that had been confounded under that name; and soon after observing a male with crenated elytra, this opinion was strengthened.

When I mentioned my suspicions on the subject to Mr. MacLeay, he assured me that he had seen similar varieties of the male; and that on examining a sufficient number of specimens, I should be convinced that they were but varieties of one species: I did so; and was nearly induced to adopt the opinion of this excellent entomologist, when I discovered sufficient characters to distinguish them from each other.

Before pointing out the marks by which these species are distinguished from each other, it may not be improper to mention the most striking characters of the group to which they belong.

Clypeus utrinque antice unidentatus. *Vertex* tuberculatus aut cornutus. *Mandibulae* valde prominulæ externe valide bidentatae; dentibus longitudine æqualibus in his, inæqualibus in illis; exteriore in omnibus crassiore.

* The female Dytici have their elytra deeply sulcated, but they sometimes occur with the sulci nearly obsolete. Nine years since I found this variety, and having discovered the Linnæan error with regard to the sexes of *D. marginalis*, which he described as species, was very much perplexed. The same variety was observed by Kirby, who regarded it as a neuter; and by Gyllenhal, who rather suspected it to be a male. Bonelli, however, lately sent me a similar variety from Piedmont, saying that he had met with three specimens, which on dissection proved to be females.

MAS capite supra clypeum in cornu elongatum apice bifidum producto : cornu pone medium superne tuberculo aut dente antrorsum spectante instructo. Ejusdem thorax medio gibboso-productus, unituberculatus, aut cornu antrorsum spectante instructus : lateribus utrinque antice productis ; laciniis saepius interne aut externe (rarius antrorsum recte) spectantibus.

ELEGANTAE ALBANA IN

XXVII. Synopsis of three of the Genera of the Order Dermaptera.

Mr. Kirby and myself about the same time perceived the characters which distinguished this as a peculiar Order, to which he proposed to give the name *Dermaptera**. Amongst the British species we have three genera, which may readily be distinguished by the number of joints in their antennæ, as well as by the characters of the *instrumenta cibaria*, &c.

**XXVIII. On the external Characters of the Stirpes
and Genera of the Family Tenthredinidea, with
Descriptions of several new Species.**

TENTHREDINIDEA.

TENTHREDO. *Linné.*

TENTHREDINETÆ. *Latreille.*

The object of this paper is to give the external characters of the Genera of this family, to enable the student to distinguish them without examining the parts of the mouth.

Entomologists are indebted to Fabricius, Latreille, and Jurine, for the observations by which the Genera have been established; and to Klug for the determination of the Species, on which he has published a series of excellent monographs in the Berlin Magazine.

Latreille's Genera **CEPHUS*** and **XIPHYDRIA**†, which he has placed in the second division of this family, I have removed from it. Their oviduct is exserted and elongated, and they altogether want the suckers‡ beneath each joint of the tarsus, a character belonging to every genus of the *Tenthredinidea*. Their *instrumenta cibaria* too are very different.

I am not certain as to the natural position of the Stirpes in the following Synopsis.

* **ASTATUS** *Klug.* **TRACHELUS** *Jurine.*

† **HYBNOTUS** *Klug.*

‡ A character to which my attention was directed by Sir J. Banks.

SYNOPSIS STIRPIUM.

Stirps 1. Antennæ breves clavatæ : articulo 3 longissimo.
Areolæ 3 submarginales, 2 marginales.

Stirps 2. Antennæ brevissimæ clavatæ. Areolæ 4 submarginales, 1 marginalis. Thorax angulis anticis squama instructus. Scutellum magnum subquadratum, postice utrinque processu dentiformi instructum.

Stirps 3*. Antennæ mediocres multiarticulatæ : MARIS subtus simplici serie pectinatæ, FEMINÆ gradatim extrorsum crassiores, articulis submoniliformibus. Areolæ 3 submarginales, 1 marginalis. Thorax angulis anticis squama instructus. Scutellum mediocre postice rotundatum inerme.

Stirps 4. Antennæ mediocres multiarticulatæ : MARIS subtus dupli serie pectinatæ, FEMINÆ medium versus crassiores intus subserratae apice acuminatae. Areolæ 4 marginales : prima inchoata, marginalis unica.

Stirps 5. Antennæ mediocres 3-articulatæ, filiformes aut extrorsum crassiores. (MARIS ciliatæ aut furecatae.) Areolæ 4 submarginales, 1 marginalis. Corpus breve crassum.

* Generis (Stirpem peculiarem forte efformantis) mare in museo MacLeay observavi. Antennæ mediocres 18-articulatæ; articulis 2 primis brevissimis, 3 longiore et cum sequentibus 14, turbinatis apice interne acute productis, articulo 18 aut ultimo externe strangulato. Thorax angulis anticis squama instructus. Habitat in Australasia.

Stirps 6. Antennæ breves 9- aut 10-articulatæ, medio crassiores apice acuminatæ, articulo 3 quarto longiore. Corpus breve crassum.

Stirps 7. Antennæ 9-articulatæ mediocres aut elongatæ. Corpus mediocre aut elongatum. Areolæ 2 marginales.

Stirps 8. Antennæ 9-articulatæ mediocres aut elongatæ. Corpus breve. Areola 1 marginalis.

Stirps 9. Antennæ multiarticulatæ mediocres aut elongatæ. Corpus mediocre depresso. Areolæ 2 marginales, 4 submarginales.

Stirps 1.

SYNONYMA GENERUM ET SYNOPSIS SPECIERUM.

Gen. I. CIMBEX.

CIMBEX. *Fabr., Latr., &c.*

Corpus obscure villosum. *Abdomen* articulo primo (maris præsertim) supra fortiter emarginato. *Femora* 4 postica inermia (MARIS valde incrassata). (*Tarsi* 4 postici MARIS articulo ultimo apice inferne corniculato.)

Sp. 1. *Cimbex fuscipennis.*

C. obscura, tarsis antennisque luteis, alis infuscatis.

Long. corp. $7\frac{1}{4}$; expans. alar. 25 lin.

Habitat

Mus. Dom. MacLeay ♂.

Politus. Caput et thorax nigri. Antennæ articulis tribus primis subfuscouscentibus. Pedes cyaneo-violascente-nigri: tibiis obscurioribus: tarsis luteis; articulo primo subfuscouscente. Abdomen violascente-nigricans, lateribus postice et ventre violascente-luteo-fuscis; segmento primo membrana lutescente.

Sp. 2. *Cimbex MacLeayi.*

C. pallide-violascente-nigricans, antennis tarsis abdomineque (basi dorsali excepto) luteis, alis hyalinis; apice areolaque secunda costali basi fuscouscentibus.

Long. corp. $13\frac{1}{2}$; exp. alar. 27 lin.

Habitat in insula St. Domingo.

Mus. MacLeay ♂.

Antennæ articulis quatuor primis pallide subfuscouscentibus.

Abdomen articulo primo membrana lutea.

Sp. 3. *Cimbex Americana*.

C. capite thoraceque nigris, abdomine intense violaceo : ventre fusco-nigro, antennis tarsisque luteis, femoribus tibiisque intense cyaneis, alis hyalinis : apice areolaque secunda costali antice fuscescentibus.

Long. corp. $13\frac{1}{2}$; expans. alar. $25\frac{1}{2}$ lin.

Habitat in America Georgia.

Mus. Francillon, Nost. ♂.

Affinis certe *C. femoratae*. Antennae articulis duobus primis pernigris ; articulo tertio basi praesertim subfuscescente, articulis quarto et quinto saturate luteo pallide subfuscescientibus. Tarsi (quatuor postici praesertim) articulo primo subtus et corniculo subferrugineis. Abdomen basi membrana lutea.

Sp. 4. *Cimbex Europaea*.

C. capite thoraceque nigrante-atris, abdomine violascente-atro : ventre medio saltem lutescente aut ferrugineo. antennis tarsisque luteis, femoribus tibiisque cyaneo-violascente-atris, alis hyalinis apice areolaque costali secunda antice fuscescentibus.

Tenthredo femorata. *Linn. Fn. Sv.* 1533.

Panz. Fn. Ins. Germ. 26. 20 ♂.

Cimbex femorata. *Fabr. Syst. Piezat.* 1.

Latr. Hist. Nat. des Cr. et Ins. 13. 119.

Crabro lunulatus. *Fourc. Ent. Paris.* 362.

Long. corp. 11—13; exp. alar. $21-23\frac{1}{4}$ lin.

Habitat in Europa. In Anglia prope Dartford et Windsor rarius.

Antennæ luteæ, articulis duobus primis saturioribus, fuscis aut nigris; clava semper dilutiore. Tarsi articulo primo concolore aut subtus fuscescente; corniculo ferrugineo, fuscescente aut concolore. Abdomen basi membrana lutea.

Variat tibiis, aut tibiis femoribus coxisque brunneis, subfuscis aut subferrugineis, violaceo-subcoloratis: et abdomine lateribus medio ferrugineis, ventre ferrugineo brunneo aut lutescente.

Sp. 5. *Cimber varians.*

C. nigra, antennis tarsis membranaque abdominali luteis, alis hyalinis; apice areolaque submarginali secunda fuscis.

Long. corp. $7\frac{1}{4}$ — $11\frac{1}{2}$; exp. alar. 16—20 lin.

Habitat in sylvis Combe et Darent prope Londinum.

Colore valde variat. Abdomen saepius nigrum, variat segmentis 3—6 aut 4—6 lateribus luteis, aut luteo maculatis. Tibiae nunc nigræ, nunc luteæ aut pallide fuscæ. Alæ apice saepius perfuscæ, nonnunquam subfuscescentes. Ungues rarius subferruginei.

Marem (varietatem forte) semel observavi, abdomine lateribus ventreque ferrugineis.

Sp. 6. *Cimber Klugii.*

C. violascente-nigra, capite thoraceque nigris, antennis tarsis abdominali dorso fasciis quinque flavis; duabus primis et ultima interruptis, alis hyalinis; apice areolaque costali secunda antice subfusca.

Long. corp. $13\frac{1}{2}$: exp. alar. 25 unc.

Habitat in insula St. Domingo.

Mus. MacLeay ♀.

Sequenti valde affinis.

Sp. 7. *Cimbex decem-maculata*.

C. violascente-nigra, capite thorace ventreque nigris, antennis tarsis et membrana abdominali luteis, abdomine segmentis 3, 4, 5, 6, et 7, utrinque macula flava, alis hyalinis subfulvescentibus, apice areolaque costali secunda saturationibus.

β. Ano subtus flavo.

Long. corp. 10—11; exp. alar. 21— $23\frac{1}{2}$ lin.

Habitat in Anglia apud Windsor rarissime. (β. in Gallia?)

Mus. nost. ♀ et β.

An Tenthredo lutea *Linn. Fn. Sv.* 1534? — Abdominis maculæ duæ anticæ et posticæ parvæ, sex intermediæ majores æquales.

Sp. 8. *Cimbex maculata*.

C. violascente-nigra, capite antennis tibiis tarsisque sordide testaceis aut luteis, thorace fuscescente-subviolascente; pectore atro, abdomine supra anoque subtus flavis; segmentis tribus primis dorsalibus violascente-nigris; tertio macula utrinque flava; quarto macula dorsali violascente-nigra.

Le Frelon à échancrure et ventre jaune. *Geoff. Ins.* 2. 263.

Crabro maculatus. *Fourc. Ent. Paris.* 361.

Tenthredo montana. *Panz. Fn. Ins. Germ.* 84. 12.

Cimbex montana. *Latr. Hist. Nat. des Cr. et Ins.* 13. 122.

Long. corp. 10— $12\frac{1}{2}$; exp. alar. 21—24 lin.

Habitat in Germania, Gallia (et Anglia in sylva Darent prope Dartford).

Membrana abdominalis concolor.

Marem nunquam observavi.

Sp. 9. *Cimbex annulata*.

C. lutea, abdomine flavo, thorace disco pectore abdominisque segmentis duobus primis tertioque macula sub-violascente-fuscis, femoribus violascente-luteis, alis sub-fulvescentibus, areola secunda costali saturatiore, apice pallide fuscescensibus.

Crabro annulatus. *Fourc. Ent. Paris*. 362.

Cimbex lutea. *Panz. Fn. Ins. Germ.* 105. 14??

Habitat in Anglia rarissime. Prope Windsor semel obvia. Abdomen segmentis dorsalibus (tribus primis exceptis) macula ferruginea medio notatis.

Sp. 10. *Cimbex Griffinii*.

C. lutea, pectore saturatiore, abdomine flavo segmentorum interstitiis nigris, alis subfulvescentibus, areola secunda costali saturatiore.

Long. corp. 11; exp. alar. $21\frac{1}{2}$ lin.

Habitat in Anglia; prope Norwich ♀ semel a Dom. M. Griffin lecta, et ab illo mihi benevole missa.

Mus. nost.

Præcedenti affinis, at satis esse distincta videtur. Abdomen segmentis superne macula ferruginea notatis. Alæ apice obscurissime saturatores.

Sp. 11. *Cimbex humeralis.*

C. nigra, antennis pedibusque luteis, fronte thoracis angulis anticis abdomineque flavis ; hoc superne segmentis 1, 2, et 4, fuscis, externe macula flava notatis, aliis medio macula fusca, alis hyalinis antice fulvescentibus fusco-variis.

Le Frelon à épaulettes. *Geoff. Hist. des Ins.* 2. 262.

Tenthredo axillaris. *Jur. Hymenop. pl.* 6. ♀.

Long. corp. $9\frac{1}{4}$; exp. alar. $17\frac{1}{2}$ lin.

Habitat in Gallia, Germania (et Anglia rarissime, prope Salisbury bis obvia).

Caput scutellum et pleura luteo-ferruginea. Femora quatuor postica antice nigra. Mandibulae ferrugineæ.

Gen. II. TRICHIOSOMA.

Corpus villosuin. *Abdomen* articulo primo supra (**MARIS** præsertim) tenuiter emarginato. *Femora* 4 postica dentata (**MARIS** incrassata).

Sp. 1. *Trichiosoma sylvaticum.*

Tr. subæneo-atrum, abdome nigro-æneo ; ventre sordide luteo fusco marginato, femoribus cyaneo-atris, tibiis tarsisque luteis, alis subfulvescentibus apice fuscis.

♂. Alis apice extremo obscurissime subfuscescentibus.

♀. Thorace nigro-æneo, abdome lateribus ventreque rufescenti-luteis.

Long. corp. 8; exp. alar. 18 lin.

Habitat in sylvis prope Londinum rarissime.

Mus. Stephens ♀ α. *nost.* ♀ α, β, γ.—Mas latet.

Villi corporis cinerascentes. Antennæ articulis duobus ultimis ante clavam saepius rufescens. Mandibulæ apice rufæ; dextra dentibus obsoletis. Labrum mediocre, longius quam latum distincte pentagonum, angulis lateralibus et apicali vix rotundatis.

Sp. 2. *Trichiosoma laterale.*

Tr. nigro-aenatum, capite saturatiore, antennis nigris, femoribus cyaneo-atris, tibiis tarsis ventre lateribusque abdominis luteis, alis subfulvescentibus apice fuscis.

Long. corp. 12; exp. alar. 22 lin.

Mus. nost. ♂.

Habitat in sylvis Londinum prope rarissime.

Marem mihi communicavit Dom. G. Samouelle, qui in sylva Darent dicta lexit.

Mandibulæ atræ apice piceæ; latere interno in utraque mandibula valide tridentato. Labrum magnum longius quam latum, angulis anticis et apicali rotundatis. Villi ferruginei.

Sp. 3. *Trichiosoma marginale.*

Tr. nigro-aeneum, femoribus violascentibus, antennis, tibiis, tarsis, ventre et abdominis lateribus maculis luteis, alis subfulvescentibus apice fuscescentibus.

Long. corp. 7; exp. alar. 15 lin.

Mus. Britan. ♂.

Habitat

Antennæ articulis duobus primis nigris. Mandibulæ apice rufescentes. Labrum paulo latius quam longum lateribus anticis subdilatatis, apice subrotundato.

Sp. 4. *Trichiosoma Latreillii.*

Tr. æneo-nigrum, capite antennisque nigris, abdomine supra purpurascente-nigro, femoribus violascentibus, tibiis tarsisque luteis, alis subfulvescentibus apice fuscis.

Long. corp. 11; exp. alar. 20 lin.

Habitat in Gallia?

Mus. nost. ♂ et ♀. Communicavit Latreille.

Villi ferruginei. Mandibulæ apice rufo-ferrugineæ. Labrum ♂ fere rotundatum angulis anticis apiceque paululum productis. Variat antennis articulis duobus ultimis ante clavam ferrugineis.

Sp. 5. *Trichiosoma Lucorum.*

Tr. nigrum, thorace æneo-nigro, femoribus cyaneo-atris, tibiis tarsisque luteis, alis subfulvescentibus apice fuscis (labro ♂ magno).

Tenthredo Lucorum. *Linn. Fn. Sv.* 1537.

Cimbex Lucorum *auctorum.*

Long. corp. $6\frac{1}{2}$ —10; exp. alar. $15-18\frac{1}{4}$ lin.

Habitat in Europa (in Anglia vulgatissime).

Mandibulæ apice rufæ aut piceo-rufæ, bidentatæ. Labrum ♂ magnum paulo longius quam latum, angulis anticis totis et apicali paulo rotundatis; ♀ parvum. Villi ferruginei, thoracis et abdominalis basi saturationes. Antennæ variant articulis internediis totis aut apice luteis. Venter niger, fuscus aut testaceus.

Sp. 6. *Trichiosoma Scalesii.*

Tr. æneo-nigrum, capite atro, femoribus purpureo-violascenibus, tibiis tarsisque luteis (mandibulis ♂ parvis).

Long. corp. $5\frac{1}{2}$ — $7\frac{1}{2}$; exp. alar. $12\frac{1}{2}$ —15 lin.

Mus. nost. ♂ et ♀.

Habitat in sylva Combe dixta, rarius. ♀ communicavit Dom. R. Scales.

Villi ferruginei, thoracis et abdominis basi saturiores.

Mandibulæ bidentatae apice rufescentes. Labrum ♂ latius quam longum angulis anticis rotundatis; apice nullo modo producto; ♀ minutum.

Sp. 7. *Trichiosoma unidentatum.*

Tr. nigrum, capite thorace abdominisque basi ferrugineis dense villosis, femoribus violascentibus, tibiis tarsisque luteis, alis subfulvescentibus apice fuscis, mandibulis rufis unidentatis.

Long. corp. 7; exp. alar. 14 lin.

In sylva Darent prope Londinum semel obvium.

Mus. nost. ♂.

Gen. III. CLAVELLARIA.

CLAVELLARIA. Lamarck.

Corpus villosum aut obscure villosum. *Abdomen* articulo primo tenuiter emarginatum. *Femora* 4 postica inermia (MARIS incrassata).

Sp. 1. *Clavellaria Armerinæ.*

Cl. nigra cinereo-pubescent, labro albido maximo cordato; basi late truncato, antennis articulo ultimo tibiis tarsis ventre anoque rufesceni-luteis, alis hyalinis areola secunda costali apiceque fuscescentibus.

Tenthredo Armerinæ. *Linn. Fn. Sv.* 1536.

Cimbex Armerinæ *auctorum.*

Long. corp. 9; exp. alar. 15 lin.

Habitat in Europa. (In Anglia ♂ apud Windsor bis obvia.)

Corpus villosum. Abdomen segmentis duobus ultimis totis et antepenultimo apice rufescenti luteis. Mandibulæ valde elongatae graciles.

Fœminam nondum vidi.

Sp. 2. *Clavellaria marginata.*

Cl. nigra, antennis apice tibiis tarsisque luteis, abdomine segmentis posticis margine albis, ventre fasciis et margine labroque albis.

Tenthredo marginata. *Linn. Syst. Nat.* 929.

Panz. Fn. Ins. Germ. 17. 14. ♀.

Cimbex marginata *auctorum.*

Long. corp. 8—10; exp. alar. 15— $17\frac{1}{2}$ lin.

Habitat in Europæ sylvis. Apud Windsor nonnunquam ♀ legit Dom. Griesbach—Mas latet.

Gen. IV. ZARÆA.

Oculi ♂ postice contingentes.

Z. atra, tibiis tarsisque luteis, alis anticis fascia fusca (abdomine ♀ basi albido).

Tenthredo fasciata. *Linn. Fn. Sv.* 1538.

Panz. Faun. Ins. Germ. 17. 15.

Cimbex fasciata *auctorum.*

Long. corp. $5\frac{1}{4}$; exp. alar. 11 lin.

Habitat in Europæ sylvis. In Anglia rarer.

Abdomen maris totum nigrum.

Gen. V. ABIA.

Abdomen MARIS macula obscura sericea elongata postice notatum. Oculi ♂ postice valde approximati.

Sp. 1. *Abia nigricornis.*

A. antennis pernigris, alis fascia media maculaque apicali fuscescentibus, pedibus flavis; femoribus nigro-aeneis.

Tenthredo nitens ♀. *Linn. Fn. Sv.* 1539.

Cimbex sericea var. *Fabr. Syst. Piczat.* 18.

Cimbex aenea. *Klug in litteris.*

Long. corp. $4\frac{3}{4}$ — $5\frac{1}{4}$; exp. alar. $9\frac{1}{4}$ — $10\frac{3}{4}$ lin.

Habitat in Angliæ, Galliæ sylvis. Anno 1815 observavi.

Abdomen supra æratum. Thorax ærato-ater.

Sp. 2. *Abia sericea.*

A. antennis ferrugineis, alis fascia media strigaque apicali fuscescentibus, pedibus flavis, femoribus nigro-aeneis aut purpurascientibus.

Tenthredo sericea. *Linn. Syst. Nat.* 2. 921.

Cimbex sericea auctorum.

Panz. Fn. Ins. Germ. 17. 16. ♂ 17. ♀.

Habitat in Europæ sylvis.

Magnitudo præcedentis. Abdominis dorsum viridi-æneum.

Thorax æneo-niger, lateribus sæpe viridi nitentibus.

Sp. 3. *Abia brevicornis.*

A. antennis brevibus femoribusque ferrugineis, alis linea transversa medio maculaque obscura apice subfuscescen-tibus, tibiis tarsisque flavis.

Magnitudo omnino præcedentium. Antennæ breviores.

Corpus subtus æneum purpureo viridi et cœruleo nitens.

Caput et thorax viridi-ænei. Abdominis dorsum viridi-nitens.

Gen. VI. AMASIS.

Corpus nudum punctatum. Abdomen articulo primo in-tegro.

Sp. 1. *Amasis obscura.*

A. nigra.

Tenthredo obscura. Fab. Ent. Syst. 2. 107.

Panz. Fn. Ins. Germ. 84. 13.

Cimbex obscura auctorum.

Habitat in Succiæ, Germaniæ nemoribus rarius. Apud Messinam observavit Dom. Swainson, qui mihi commu-nicavit.

Sp. 2. *Amasis lactea.*

A. nigra, abdominis dorso subcroceo, segmento primo toto segmentisque alis basi nigris, pedibus flavis; femoribus basi tibiis posticis apice tarsisque omnibus apice nigris,

Tenthredo lœta. *Fab. Ent. Syst. Suppl.* 214.

Panz. Fn. Ins. Germ. 62. 6.

Cimbex lœta auctorum.

Habitat in Germania, Anglia. Prope Bristol bis obvia.

Variat ventre nigro aut medio aut toto subcroceo vel luteo.

Stirps 2.

Gen. PERGA.

Antennæ 6-articulatae; articulo ultimo clavam efformante.

Labrum transversum subsemicirculare. *Mandibulæ* arcuatæ latæ, apice acutæ, latere interiore tenues, basin versus obtuse unidentatæ. *Palpi* filiformes. *Pterigostea submarginalia transversa* medio bullata. *Tibiæ* 4 posticæ latere interno spinula instructæ. *Calcarii* mediocres acuti simplices.—Genus artificiosum altero die sedulose elaborandum.

A. Alis anticis ante areolam marginalem non prominentibus. (Antennis articulo tertio duobus sequentibus longiore.)

a. *Areolis submarginalibus duabus primis confluentibus; ultima ad basin superne subacuminata: areola marginali elongata antice et postice acuminata.*

Sp. 1. *Perga polita.*

TAB. 148. Fig. 3.

P. brunneo-violascens polita nitens, thorace ferrugineo; disco maculâ squamis pleuris scutello capite antennis coxis tibiis tarsisque flavis, femoribus ventreque subvio-

lascente-ferrugineis politis, stigmatibus postice albido notatis, alis fulvescentibus; pterigostiiis marginē stigma-teque ferrugineis.

Long. corp. $10\frac{3}{4}$. Exp. alar. $22\frac{1}{2}$ lin.

Habitat in Australasia.

Mus. nost. ♀ Francillon ♂.

Mandibulæ saturate ferrugineæ, latere interiore apiceque nigris. Scutellum postice ferrugineo-brunneum.

b. *Areolis submarginalibus perfectis; ultima basi arcuato-emarginata; areola marginali elongata antice et postice acuminata.*

Sp. 2. *Perga bicolor.*

TAB. 148. Fig. 5.

P. pernigra, clypeo capitis lateribus, thorace ante squamas utrinque, scutello, tibiis, tarsis coxisque quatuor posticis albidis; tarsis tibiisque 4 posticis apice nigris, alis hyalinis apice fuscescentibus; pterigosteis nigris.

Long. corp. $7\frac{1}{2}$; exp. alar. $11\frac{3}{4}$ lin.

Habitat in Australasia.

Mus. MacLeay ♀. Mas adhuc latet.

Femora postica basi albida.

c. *Areolis submarginalibus perfectis; ultima basi recta; areola marginali ovata.*

Sp. 3. *Perga Latreillii.*

TAB. 148. Fig. 2.

P. luteo-ferruginea, capite, thoracis dorso tarsisque posticis basi nigris, pectore ventreque lutescentibus; clypeo vertice maculis, scutello, squamis, thoracis margine pleurisque albidis, alis hyalinis; pterigosteis luteis.

Gen. II. NEMATUS.

Antennæ corpore longiores MARIS, articulis apice sæpe in-crassatis aut interne subproductis.

* *Antennæ* MARIS mediocriter ciliatæ ; articulo tertio basi simplici.

Nemati : 1. niger, 2. luteus, 3. lucidus &c.

** *Antennæ* MARIS ciliis elongatis ; articulo tertio basi infra corniculato.

Hujusdivisionis typum observavit Clarissimus Monographiæ Apum Angliæ auctor, qui mihi communicavit. Species duas indigenas possideo.

Gen. III. CLADIUS.

Antennæ corporis longitudine aut vix longiores; MARIS
ciliis elongatis; articulis 3, 4, et 5 apice supra valde,
6 et 7 (hoc præsertim) paulo productis; articulo tertio
basi infra corniculato.

Cladius difformis Latr.

Habitat in Europa. In Anglia apud Combe Wood et prope
 Bristol.

Stirps 9.

PSEN. *Schrink*.

Larva pedibus spuriis nullis.

Lydae *Klug.* 1. *Betulæ* 2. *Erythrocephala* &c.

**XXIX. On the Rhipiptera of Latreille, an Order
of Insects named by Kirby Strepsiptera.**

Xenos, the genus serving as the type of this singular Order of Insects, was discovered by Rossi, who referred it without hesitation to the *Hymenoptera*, and placed it next to *Ichneumon*. Another genus of the same order was found by Kirby, and was described in his celebrated *Monographia Apum Angliae* under the name of *Stylops*, with expressions of doubt as to its systematic situation. Latreille soon after received from De Brebisson a species of *Stylops*, and at the end of his *Genera Insectorum et Crustaceorum* observes that it seems to disturb our entomological systems, not being referable to any of the established orders. Professor Peck detected a new species of this group in America, and communicated it to Kirby, who considered it to constitute with his *Stylops* a peculiar order of insects, on which he gave to the Linnaean Society of London, in 1811*, a dissertation.

I adopted the characters that were laid down by this learned entomologist, as well as the name *Strepsiptera*, by which it was designated. Since then, Latreille has convinced me that the supposed elytra are but moveable processes attached to the anterior part of the thorax ; whereas true elytra arise from the second segment of the trunk, and always more or less cover the wings, which these parts do not touch. Anxious to become acquainted with all the characters of the order, I commenced an examination of

the mouth, and was soon convinced that the parts of it were far from being obsolete ; but fearing to undertake the dissection, I submitted the specimen to the inspection of Savigny, from whose exact and almost infallible hand and eye, I felt confident of gaining the desired information, the result of which shall now be given.—He observed, that the mouth contains the whole of the usual parts which, under various modifications, exist in all insects : the mandibles are perfectly distinct from and unconnected with the maxillæ ; the maxillæ are inserted behind and somewhat below the mandibles, whose base they conceal ; and the articulation of the labrum is very evident, from its semi-transparency.

RHIPHIPTERA.

STREPSIPTERA. *Kirby, Leach.*

RHIPHIPTERA. *Latreille.*

DIPTERA RHIPIDOPTERA. *Lamarck.*

CHARACTER ORDINIS.

Os labro, mandibulis maxillis et labio instructum.

Antennæ bipartitæ.

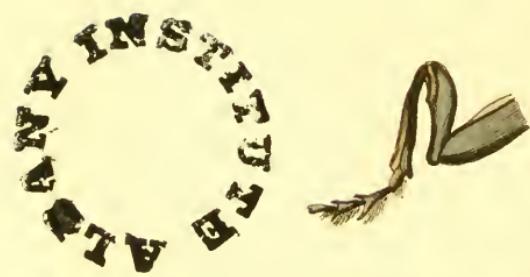

Thorax utrinque antice ad pedum anticorum basin processu mobili instructus.

Alæ duæ membranaceæ longitudinaliter plicatiles ; pterigostii radiantibus.

LARVA in Hymenopterorum abdome latet parasitica.

PUPA coarctata inter abdominis segmenta affixa.

I have seen but one genus of this order, viz. *Stylops*, of which the following is the character.

© 2008 H. T. Casner & P. J. Casner

STYLOPS.

STYLOPS. Kirby, Latreille, Leach, Lamarck.

CHARACTER ESSENTIALIS.

Antennæ ramis compressis; superiore articulato,
Tarsi 4-articulati; articulo ultimo fisco.

Character Oris (observante Savigny).

“*Labrum* coriaceum porrectum mobile a basi ad apicem sensim angustius.”

“*Mandibulæ* maxillis longiores sub labro decussantes cornæ angustissimæ lineares subarcuatæ apice acutissimæ.”

“*Mavillæ* magnæ coriaceæ cylindraceæ lobo conico subtus subconcavo, basi externe palpigero instructæ: *palpi* uniarticulati semi-membranacei ovali-oblongi lobo duplo majores.

“*Labium* coriaceum paululum porrectum, subtus carinatum, basi latum; *lingula* nulla terminali nec *palpis* discernendis.”

Savigny in litteris.

Sp. 1, *Stylops Kirbii.*

TAB. 149.

As this is the only species that I have had an opportunity to examine, it will be ridiculous to attempt a specific character; and since it does not agree with the figures of *Stylops Melittæ* of Kirby, I have no hesitation in naming it after the first of British entomologists.

A magnified representation of a leg is given at the bottom of the Plate.

Observations.

Kirby's American *Xenos* differs generically from *Stylops* in having the branches of its antennæ nearly rounded and without joints, and in having the last joint of its tarsi (which are likewise four-jointed) entire.

Since writing the above, I have received from my friend Clairville, a paper by Jurine on the *Xenos Vesparum* of Rossi; from which it would appear that this insect likewise is referable to a very different genus from the American *Xenos*. The abdomen of Jurine's insect is pedunculated; the processes attached to the anterior segment of the thorax are elongate; the wing-bones are differently disposed; and, what is of still greater importance, the tarsi are described to be composed of five joints.

Jurine's figure is very badly executed, the two sides being dissimilar; but from his description I have little doubt that a third genus will soon be determined to belong to this order.

XXX. Synopsis of the Orders, Families, and Genera of the Class Cephalopoda.

C E P H A L O P O D A.

Fam. II. SEPIIDEA.

Corpus elongatum postice acuminatum.

Pinnæ apice coalitæ. Collum liberum.

Pedes inæquales : par superum brevius :
paria 2 et 3 gradatim longiora ; par 5
pari 2 paulo longius. Os depresso.

Corpus depresso. Pinnæ longæ - 6. SEPIA.

Corpus teretiusculum. Pinnæ mediocres 7. LOLIGO.

SYNONYMA GENERUM, &c.

Ordo I. OCTOPODA.

Pedes longitudine fere æquales, a basi ad apicem interne
antliis instructi ; basi membrana coaliti. Saccus pos-
tice cum collo coalitus. Corpus ovale bursiforme, in-
fra et utrinque frenatum : freno inferiore ad sacci mar-
ginem fere attingente ; frenis lateralibus parvis.

Gen. I. ELEDONE.

ΕΛΕΔΩΝΗ Aristotelis.

Sp. 1. *Eledone moschata.*

Le Poulpe musqué. Lam. Mém. de la Soc. d'Hist. Nat.

Habitat in Mediterraneo mari.

Gen. II. POLYPUS.

ΠΟΛΥΠΟΥΣ *antiquorum*.

POLYPUS. *Rondeletii*.

OCTOPUS. *Lamarche, Cuvier*.

Ad hoc genus pertinent 1. *Sepia octopodia* Linn.; 2. *S. rugosa* Bosc. et

3. *Polypus longipes*.

P. corpore elongato-ovali glabro griseo nigro-punctulato, pedibus longissimis gracilibus; antliis magnis prominentibus.

Habitat

Mus. nost.

Gen. III. OCYTHOE.

OCYTHOE. *Rafinesque, Blainville, Leach*.

ARGONAUTA. *Cuvier, Shaw, &c.*

Sp. 1. *Ocythoe Cranchii*.

O. pedibus mediocribus; superioribus ala spongiosa.

Ocythoe Cranchii. *Leach Phil. Trans. 1817.*

Habitat in mari Africano Guineensi.

Mus. Brit.

Sp. 2. *Ocythoe antiquorum*.

O. pedibus elongatis; superioribus ala membranacea.

Argonauta Argo. *Shaw Nat. Miscel.*

Mus. Brit.

Ordo II. DECAPODA.

Pedes ordinarii a basi ad apicem interne antliis pedunculatis instructi: pedum par quartum basi simplex, apice dilatatum interne planum antliis pedunculatis instructum.

Gen. IV. SEPIOLA.

SEPIOLA. *Rondeletii.*

Sp. 1. *Sepiola Rondeletii.*

Sepia Sepiola. Linné.

Habitat in mari Europæo.

Gen. V. CRANCHIA.*

Sp. 1. *Cranchia scabra.*

C. sacco tuberculato scabro; tuberculis duris scabriusculis.
Mus. Brit.

Sp. 2. *Cranchia maculata.*

C. sacco lævi pulcherrime nigro maculato; maculis ovatis distantibus.

Mus. Brit.

Gen. VI. SEPIA.

ΣΗΠΙΑ *antiquorum.*

SEPIA *auctorum.*

Sp. 1. *Sepia officinalis.*

Sepia officinalis. Linné.

Habitat in mari Europæo.

Gen. VII. LOLIGO.

LOLIGO. *Plinii, Lamarck, &c.*

* Ad hoc genus forte pertinet *Loligo cardioptera* Peron.

* *Brachia omnia antliis simplicibus pedunculatis.*

Sp. 1. *Loligo parva.* *Rondel.* 508.

** *Brachia omnia antliis hamatis: supplementaria antliis inferioribus simplicibus pedunculatis.*

Sp. 2. *Loligo lepturo.*

L. brachiis supplementariis hainis liberis, cauda abrupta tenui.

Mus. Brit.

Corpus et brachia externe laevia tuberculis nonnullis in lineis longitudinalibus interruptis digestis.

Sp. 3. *Loligo Smythii.*

L. brachiis supplementariis hainis infra membrana instruc-
tis, cauda gradatim attenuata.

Mus. Brit.

Corpus et brachia externe tuberculata; tuberculis purpureis
apice albidis.

*** *Brachia ordinaria antliis simplicibus pedunculatis:*
supplementaria antliis hamatis; inferioribus peduncu-
latis simplicibus.

Sp. 4. *Loligo Banksii.*

L. pedibus ordinariis antliis globosis, pinnis rhombum ef-
formantibus.

Mus. Brit.
